1. Dual RCA jack to S-video cable?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-01 03:26:29 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <521aool.lmcclure@delphi.com>
Source record: 95746

Does anyone know of a source for a ready-made, inexpensive (i.e., less than $20 cable that has dual RCA jacks on one end, and an S-video plug on the other).

Yes, I know their are alternatives. I could drop by the local Best Buy, pick up a 6' S-video cable for $8, lop off one end and solder on a couple of inline RCA jacks. Alternately, I could call up Redmond Cable and have them make one up, if I wanted to shell out some significant bucks.

The reason I am looking for such a cable is so that I can plug my Atari 8-bits, C-128, and Plus/4 into the S-video input on my TV without either having to build custom cables for each computer, or alternately hacking a S-video (mini-DIN 4) port onto each one.

A ready-made cable would likely be more sturdy than something I would make up. Frankly, if I end up doing it myself, I'll likely just build a small conversion box with dual RCA jacks on one side, and a S-video jack on the other.

That said, if no one knows of a source of such a cable, would anyone else be interested in such a cable or interface box?

P.S. - A ready made Atari-8 to S-video monitor cable would be an acceptable alternative, although for various reasons, not as desireable as one with dual RCA jacks.

2. Atari 400/800 to PC Monitor??

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-01 04:52:17 UTC
From: joneil@infi.net
Message-ID: <3e5ce1$5gt@lucy.infi.net>
Source record: 95747

Is there an adaptor cable or diagram for one out there that will allow me to connect either my 400 or 800 (probably the 800 since it has the monitor out jack) to a PC type monitor? I'm sure I can find a good deal on someones old EGA or CGA monitor and much rather have another 14" monitor on my desk than a 19" color TV!

Also , what is the filename for PC Xformer?? Having trouble finding it!

Source record: 95749

In a message dated 1-1-95, John O'Neil said:

"Is there an adaptor cable or diagram for one out there
that will allow me to connect either my 400 or 800
(probably the 800 since it has the monitor out jack)
to a PC type monitor?"

You need to get ahold of the December '93 issue of Atari Classics. One of the articles therin showed how to interface an RGBI (CGA) or mono TTL monitor with the Atari 8-bit machines.

"I'm sure I can find a good deal on someones old EGA or
CGA monitor and much rather have another 14" monitor
on my desk than a 19" color TV!"

You should be able to find a used composite or split video monitor (i.e., Commdore 1701, 1702, or 1802) for about the same price as a used CGA or EGA monitor. For that matter, nose around comp.sys.amiga.marketplace, and you might find a used 1080 or 1084 in the price range you are thinking of.

5. HELP! Sparta w/PC Xformer3.0

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-01 06:19:23 UTC
From: ab588@yfn.ysu.edu
Message-ID: <3e5hhb$oun@news.ysu.edu>
Source record: 95750

On pg.3 of the manual I got with my registered copy of PC Xformer3.0
it says "something" about running SPARTADOS bootable disk images, but
no further instructions on how to make a bootable Sparta disk image.
I've tried to use DCM2DSK to make .atr files and disk2XFD to make
.xfd files but PCX3.0 wont run the resulting files.
Help! Has anyone ever been able to make a usable sparta diskimage for
PCxformer?
Most of my software is in sparta format and makes calls to sparta
subdirectories.
I have successfully made .atr files that do run Syncalc, Synfile and
Zybex that are supposedly protected.
I just want to run my AtariWriter plus 3.0 from my486.
That would be something!!

> But I don't see that happening for those who prefer command line over
> GUI.
>

You can add me to the list as well. I prefer the command line rather than GUI. I'm a computer programmer and write both ms-dos and Windows driven software.

If I had a choice, I'd rather launch an application (like Norton, or WordPerfect) from the command line. Why? Well, it starts instantly, has ALL the low 640k area plus the high mem to boogie in, without having to worry about sharing memory, etc.. with Windows. All this clicking from icon to icon and switching back and forth is a pain when you want to begin and end an application then move to another FAST. Maybe that will change with Chicago, but the advantage a Mac has over the IBM platform is that it is in the FIRMWARE, not sharing memory and being OVERHEAD.

Anyway, back to the original stuff.... the 8 bit was one of the most advanced computers for it's time because of the custom chips incorporated into the design. The cpu chip didn't have run the whole show. In addition, the disk drives had custom chips and were "smart", unline the IBM drives which had to be continually monitored by the cpu.

Lets even mention that the ST had a far better and stable GUI than earlier versions of Windows or TopView. The ST in comparison ran faster.

.....if it had only been marketed more vigorously, the world would be using Ataris not IBM clones. Ah well, they'll learn eventually ...YA RIGHT!! I haven't seen ONE Falcon ad during Christmas, and from what I hear, Atari is going great guns in Europe, but NOT in North America. The more things change, the more they stay the same. I have never seen a company that was so arrogant to a userbase in my life.

PC Xformer's filename is XF2.ZIP, XF25.ZIP and I think also XF255.ZIP.
THese are versions 2.0, 2.5, and 2.55, all public domain version which are
not as compatible as the commercial version 3.0 available from Branch Always
Software and Atari dealers. (Has BRASOFT started selling it to normal PC
dealers? I wonder how many more he would sell!?)

Message-ID: <3e5so7$7vu@nic-nac.CSU.net>
Source record: 95744

Hmm.. Ok, I wrote the PCXF3.0 manual and I guess that's my goof. There is currently no version of SpartaDOS which will run under PC Xformer, to the best of my knowledge. I believe Fine Tooned Engineering (FTe) has the rights to SpartaDOS now and has released it as PD (?) and made a few alterations to it, but I don't think a PCXF3.0-compatible version has been released yet. I'm not sure exactly who's fault it is, PC Xformer's or SpartaDOSes, but my bet is it's PCXF's since, well, SpartaDOS and real Ataris have been out quit a while longer. :)

Why do you need SpartaDOS to run AtariWriter+. Also, will any of your software which "calls SpartaDOS directories" run under MyDOS? MyDOS supports not only it's ":"-separated path format ("D1:GAMES:SPACE:"), but also SpartaDOS's ("D1:GAMES>SPACE>"). Again, be sure the SOFTWARE runs under MyDOS, not just that the subdirectories can be called. SpartaDOS is a much more complex monster and has different I/O calls and memory areas being used.

Good luck!
-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
William (Bill) Kendrick / | \ ** New Breed Software **
BTW- SpartaDOS wasn't covered much in the PC Xformer manual because
1) The "average joe" user would be using PCXF for games, mainly. Most games either don't need SpartaDOS or won't RUN with SpartaDOS (or don't even HAVE a specific real DOS)
2) I don't use SpartaDOS, don't know too much about it, and it's so much like MSDOS that an MSDOS user of PC Xformer could probably at least get around ok in SpartaDOS.

9. Binary loading compiled Action! programs from WITHIN an Action! prg.

Newsgroup: comp.sys.atari.8bit

hhhhhhhHHHHHHHEEEEEELLLLPPPPP!

To put it bluntly, this:

```
Close(1)
XIO(40,0,1,4,0,"D:INTRO.COM")
```

does NOT load and run "D:INTRO.COM", but instead loads and runs "DOS.SYS"
(ie, it acts either like the program ended or gets an error during the
load and falls back to the DOS menu).

ARGH!

What I'm doing is making a REALLY big game which is going to be in multiple
files which are chained; that is, when one part is completed, it loads and
starts up the next part.

Now, I can binary [L]oad and run "INTRO.COM" fine from the MyDOS menu..
Works like a beaut'. But calling the MyDOS binary load command through a
general I/O (XIO) call just doesn't do it! WHY!? What am I missing!?
What isn't Action! doing!?

I've binary loaded stuff successfully before from Action!.. The SX212 R:
handler I think it was... of course, that's not a full blown program like
"INTRO.COM" is.

What AM I doing wrong!?

SOMEONE HELP >FAST<!

Thanx

Body handling: HTML body converted to readable text

A program people used a lot with the 800 was CARTCOPY. You just run the program with BASIC in the left slot, then plug the cart in the right slot. The program then writes out a load & go file of the cart. It's been my experience that these will run with an 800, but not always with an XL or XE series computer. I'm just letting you know in case the emulator doesn't work with them, it may not be it's fault. If you can't find the file let me know & I'll see if I can find a copy.

Maybe if I explained my setup and hardware, you guys can help
me out better. I have an Atari 800 with two cartridge slots and
48K of RAM...I use OSS's DOS XL. I can boot with a BASIC XL
cartridge in the left slot, and a game cartridge in the right slot,
as well as a DOS disk in the disk drive.

By using OS functions, I can obtain (I _think_) a dump of the
contents of the right cartridge.

Now, I have a ROM image on my disk drive. I've tried binary
loading the ROM image, but it ends up with a crash that
results in a cold restart.

Can anyone help me out with the memory addresses of the
left and right cartridge slot?

And also, how do I load my ROM images into memory?

Thanks,
Wes Brown

Joe, it looks like we have to get Bill to stop using Mydos! <grin>

I have SpartaDOS working with PC Xformer here in house, and will
be uploading it to the networks in the next week or so...

There are problems with using an ATR disk image in Double Density,
and the only way to get a Double Density disk to work at present
is to use and XFD style image. It gets kinda complicated, but I
will be doing a comprehensive review of PC XFormer 3.0 in the
next issue of Atari Classics...

Mike

>E-Mail: Russ.Gilbert@apk.wariat.org
Mr. Gilbert is quite correct about Omnimon being able to handle this.
For example, with 8k Basic (the technique should work with most 8k carrts..);

The basic idea is to load basic, pop into Omni and write the cartridge area
to disk. Then you shut down, remove basic, load up DOS and pop into Omni
again. This time you read the file you made into memory starting at the
cartridge area ($A000), pop out of Omni and go to DOS and use the 'K'
command to save Basic as a binary file (DOS will save the file with the
neccessary sector links) using a start adderess of $A000 and an end address
of $BFFF. This is the cart area for a typical 8k cartridge. The last step is
to use Omni to read the file into memory one more time to append some load
vectors to the end of the file, to move the screen down, initalize and start
the program. I have detailed instructions for all of this if anyone is
interested.

>
[wade, wade, chop, chop]

Predictably enough, the topic of commercial advertising in a Usenet is rife in more than a few newsgroups. I'm also a musician, and there is a lively conversation going on in the bass players sig about advertising.

BTW, I love your "theater" example!

What we've been getting on the other sig, is that age old and very tiresome bleat of "free speech". Most of us have posted back saying that free speech is fine -- but put it into a biz sig. This of course is totally ignored, and the users-cum-commercial-advertisers continue to bray their arguments.

It is essentially a no-win situation. The only way to counter this is to flame the offender. However it wastes disk space, and is a pain to wade through those increasing silly messages. So.... what is the result...fewer persons access and post/read the newsgroup, and everyone loses.

A newsgroup exists by the sheer force of "newness". The user accesses it to see what new messages have been posted that are either of passing interest, directly related to his/her needs, or to join a debate (like this post for instance).

To be completely fair, there IS some advertising that takes place on THIS newsgroup almost regularly by commercial users. However the difference is that the advertising is extremely low key and is in the nature of asking users what they want, and the status of the product being developed. Here I am referring to FTE. These guys are developing a product WITH OUR INPUT, and reporting back as to the status, pitfalls, tradeoffs, that they have found while engaged in that process. This is a totally different type of information exchange and cannot be called advertising. As a matter of fact, without the FTE people posting, this newsgroup would be considerably diminished.

The other music newsgroup I was referring to, had some advertisers that did a quick post (much hype), and that's it. No long term interesting information exchange -- virtually like picking up the telephone, placing

the ad and finished.

This usenet has been quite good in that respect, and the posters have been quite responsible.

Well, I have no experience with DOS XL, but...
To load and run the disk image of your ROM cart it must have been saved ala
the DOS 'K' command, with sector links, to tell the OS where the next
sector of the file is located. The file must also have the first 2 bytes of
the file set to FF FF, DOS expects this at the beggining of all binary load
files. Next, the end of the file will doubtless have to have some load
vectors appended to it. For the Basic cartridge these bytes are:
6A 00 6A 00 90 E2 02 E3 02 F6 F3 00 98 08 98 20 06 98 6C FA BF 6C FE BF E0
02 E1 02 00 98

: I got a lot of original 8K cartridges, which I'd doubt is copy protected. I'm talking
: about 1979-1981 era cartridges. :) Stuff like Star Raiders, Dig Dug, etc. I'm still
: asking HOW. :) How do you copy these cartridges?

Many years ago, I remember a device called PIL. This device was a small
card with a switch on top. When the switch was off, RAM memory in the
cartridge area could be written. When it was switched on, it disabled the
cpu memory write line to the cartridge area, thus making the RAM between
0x8000 to 0xBfff unwritable.

Operation of the device was simple :-

1. The switch was set to the off position
2. The PIL disk was inserted which contained a menu program that
loaded the appropriate ROM image into the RAM area.
3. The switch was set to the on position making the RAM unwritable.
4. System reset was pressed, the OS was then unable to write to
the 'Protected RAM' area, and assumed that it was ROM.
5. The OS would then run the software exactly as it would run a
real ROM, i.e. from the vectors at the top of cartridge memory.

This device only worked for cartridges that were not banked switched,
but it would also allow protected cartridges to be run since even
the ROM program could not overwrite itself.

I notice that in the PC XFormer directory there is a file called
'ataribas.rom'. Perhaps PC XFormer has the ability to treat this
area as ROM. If so, you could rename your ROM image to 'ataribas.rom'
and then run PC XFormer (or does it allow you select the ROM?)

The Atari 800 had two cartridge slots, and although not recommended,
you could sometimes insert a second 8K cartridge into the unused
slot while basic was running a program (Although it usually crashed
the machine). If the machine kept running the program could dump the
ROM image from 0x8000 to 0x9fff to disk. Unfortunately when the
cartridge was inserted it appeared in the screen address space
making the screen unreadable, so the basic program could monitor
the start key and dump to disk when pressed. If it didn't dump to
disk, the machine had crashed and you had to restart.

I have no idea were you can obtain a PIL, but I remember that it
had used a single IC with the chip number rubbed off.

>
SpartaDos (at v3.2g now) was released as ShareWare - $20 to register, as I recall. Mike at FTe is looking at making Sparta PCXF compatible, but has a few other projects to complete first. He did release a version on Mac65 for PCXF though; it's at UMich, though I forget the name and directory.

David Firth (david@signus.demon.co.uk) wrote:

: I have no idea were you can obtain a PIL, but I remember that it
: had used a single IC with the chip number rubbed off.
^^^^^^^^^^^^^^^^^^^^^^

I have just found the device and the chip number is on it. It is a
74LS000 quad 2-input NAND gate and the only other component is a switch.

Sorry I have no details on the connections on the cartridge
slot but assuming :-

16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 (to rear of computer)
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 (to front of computer)

2 is connected to pins 9 & 10 on the 74LS00.

14 is connected to pins 1, 2, 4, 5 and 7 on the 74LS00.
Probably only pin 7 (ground) on the 74LS00 need be connected,
It looks like the remaining connection are to avoid floating
inputs on unused nand gates.

15 is connected to pin 8 on the 74LS00 via the switch.
(RAM enabled when the switch breaks the connection)
(ROM enabled when the switch makes the connection)

15 is also connected to 17 (on cartridge port)

18 is connected to pin 14 on the 74LS00 (vcc) and pin 14 is soldered to
pins 12 and 13 (again probably to avoid floating inputs?)

Don't attempt this if your not sure what you are doing since it could
damage your machine if connected up incorrectly (or if I have described
it incorrectly!)

Source record: 95764

(Wes Brown asks how to load his ROM cart images into memory.)
Somebody else gave you some hex binary code. Maybe this will help you understand what you gotta do to get your ROM disk files to work. Remember that a binary save from DOS puts a 255,255,load address lo, load address high header on your ROM image file. If you just dumped the area $A000 to $BFFF to disk using BASIC, then you don't have the load header. So here's what you have to do to make a load from DOS file out of your disk ROM image.
1. Move the Display list, screen memory and RAMTOP ($6A) down. This is done by putting a $A0 in $6A and opening the screen editor E: device. You will have to make a binary load file with assembler editor or make a BASIC file that makes this header for you.
2. Load in your ROM image. $A000 to $BFFF
3. Append a run address six bytes to $2E0, $2E1, run address to your load file.
This should work. Short of posting a BASIC program that will do all this, I would suggest you do it how you wanna do it, but do it to your BASIC cart first, so you know your system works. It may not work on some carts because they are protected or are banked.
(The run address for a cart is located at $BFFA,B the cart may need to be inited at address $BFFE,F). The run address for BASIC is $A000.

Actually, the instructions that come with Omnimon are kind of, well I'll explain. 1st, the example given is not right. The cart init & run address for the example of making basic into a file are wrong. It happens that they are right for the assembler editor cart though & I think they confused the carts/instructions. 2nd the jump they show to $F3F5 is completely illegal. The legal jump is not all that harder to do, as it is, files will only run under OMNIMON, OMNIVIEW, or a 800/400 OS. 3rd, all you have to do is have a DOS disk in drive #1. Hit B<return> from the OMNIMON command line & DOS will boot no matter what cartridge you have plugged in. Then all you have to do is a binary save 'K from the DOS menu with 'filename',$A000,$BFFF, INIT, RUN (if I have them in the right order?) & DOS takes care of all the rest: Takes maybe a minute.
IMO: I love my OMNIMON. I spent maybe a week or two using it to burn some new carts for ones I had that were going bad, but for the last 9 years or so I've used it for programing, saving corrupted disk, debug'n code. I think a lot of people originally bought it for it's ability to crack stuff & it was advertised as such, but the thing is such joy to have around when I program I couldn't imagine using my 8 bit without it.

27. Alt. Reality, City

(What a great time to buy Atari8 software. I got Alt. Real, city and
dungeon for $6 apiece from a well known vendor that had lots of other
specials on for REALLY CHEAP.)
The book says you chose whether you wanna be good or evil. But the only
way to get the bucks (short of resurex) is to beat somebody ('Kill'
somebody) and get their stuff. There's no way to make an honest buck
in Alt. REal. So, I loved Price's graphics and music and the intro
song and spaceship are worth the $6. I don't know. I've heard lots of
people rave about this game.

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <pS45wE6.lmcclure@delphi.com>
Source record: 95772

In a message dated 1-1-95, Ben Corr said:

"Is this article available on-line somewhere?"

Not that I am aware of. However, I recall seeing something very similar, but less refined, and less well explained in a local user group letter many years ago. Therefore, there might be a file somewhere, thought perhaps lacking the completeness and clarity of the AC article.

One caveat about this mod is that the colors you get will not be the same ones you see on a composite monitor or TV. Aside from the limited palette of a CGA monitor, it has to do with how the monitor is driven by this mod. The signals are derived from the 4050 video buffer chip, where the luma signals are represented in digital form on four output pins. This means that luminance (and which RGBI pin each is connected to) determines the color. In other words, if you had a screen that would be 16 shades of blue on a composite monitor, you would instead get each of the 16 RGBI colors on a CGA monitor. Not so bad for text (in fact, down right desireable in some cases, especially if the program allows you to change character and background brightness), but with some weird or awful results for many games and demos. Imagine the CES Robot Demo, or the opening to Rescue on Fractalus, with their subtle mono-color shading, and how that would end up as a technicolor rainbow on a CGA monitor, and you'll see what I mean.

32. Cheap PC for SIO2PC use?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-02 05:12:44 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hSy4w+8.lmcclure@delphi.com>
Source record: 95773

If you have access to cheap used PC's, this may not be of interest, but if not...

In the January issue of Electronics NOW, Timeline Inc. is selling a 286 motherboard with 2 serial, parallel, floppy & IDE HD controller, and onboard VGA controller for $29.99. The Unit expands with standard 9-bit, 30-pin 256K or 1meg SIMMs up to 8 megs. One drawback is no expansions slots, other than one proprietary connector, but since it has everything any SIO2PC user should need, why worry? Other stuff: 12Mhz 80286 CPU running with 1 wait state, Phoenix BIOS, real-time clock, onboard speaker.

If you need something that runs with a cheaper monitor (i.e. CGA, TTL, or composite), there is another company selling an XT board with built in CGA/Hercules video, parallel and serial for $19.95. However, seeing as this has no HD interface, unless you plan on running only from floppies, it is probably not a good deal. Most folks could likely find a complete XT system complete locally with a hard drive for less than they could build this board into a similar system.

33. Power Supply Question

Recently I picked up a power supply which looked like it would
work with my 800xl. (it does, btw, anyway...)
While the physical shape of the "brick" is a little different
from the one that came with my 800xl, it has the same part number
(CO61982) Thing I'm wondering about though is on my (old) power supply
there's a box midway between the brick and the computer-side cable.
the "new" one lacks this box. (the RF cable also has a similiar
looking box btw)

I'm using MyDOS, and it mimics a lot of SpartaDOS XIO calls (at least v. 4.50 and above do). Make directory is both some number for MyDOS, and some number for SpartaDOS. (I think the MyDOS one is 41, but you can also use SpartaDOSes).

In the MyDOS manual at the end of the description of XIO 39, it says that XIO 40 is identical, to put it breifly. :)

.. Russ Gilbert e-mailed me a neat routine for Action! which copies itself into page 6, stores the required data there, and then calls the page 6 code. It works for me, so I'm VERY happy! (THanx AGAIN Russ! :))

If anyone wants, I can post it or put it on UMich..

I wrote my own modified version of ATARIO that would read and write atari
disks. (I could never get it to work in 1050 double density as the source code
suggested would be possible). "Util" used to slow down as the disk became full.
Unfornately, It resides on a 5.25" disk, and I only have acess to a PC with a
5.25" disk and I was writing it on someone else PC that had Turbo-Pascal, and
I don't. Most posts seem to say that "Util" works better when the disk is
formatted on an Atari. I usually had the best results when the disk was formatted
with "Util" on a PC. One problem I has with Util was that if an error occurred the
drive appeared to remain in Atari Mode (256 byte sectors). "Util" is the utility
written in C that will read and write Atari True-Double density disks on A PC. It may
have been updated since I last seen it. I sent to the archive a program that can read
an atari disk, convert it to an .XFD image file and send it to a PC via Xmodem. You
need to have an RS232 port on the atari and PC and a null modem cable as well as
a program on the PC side capable of using Standard XModem (Not Xmodem-CRC).
The program can also receive disks. I am awaing info on how to implement XModem-CRC.
If the program doesn't appear or you have any problems to get it to work send me some

email. It has mainly only been tested with R-verter type handlers and interfaces.

William Kendrick <kendrick@zippy.sonoma.edu> writes:

>AHH! Alternate Reality for >>$6<<!? WHERE! Both City And Dungeon?
>(ie, $6 total, $6 a piece, or is only the City available (for $6)?)

Both are available at American Techna-Vision. Each is $6, or
a total of $12 for both. American Technavision, a long-time Atari 8-bit
software, hardware and parts vendor, has lowered their prices
drastically recently. While their selection of programs is no longer as
extensive as it once was, it is worthwhile to get a copy of their
flyer/catalog. Other interesting stuff they sell is 400/800 power
packs for $4.50 and XE/XL power packs for $9.95. SIO cables are $1.95
each (3 foot), 1050 drive mechs are $17.50 or two for $29.95 (BRAND NEW
TANDON MECHS!), 64K 600XL memory upgrade (requires soldering three
wires) for $14.95, The Seven Cities of Gold (GREAT EA game) for $4.00,
COMPUTE!'s Mapping the Atari (XL/XE edition) for $9.95 or 400/800
edition for $5.00, F-15 Strike Eagle for $4.00....you get the picture. :)
All this stuff is brand new. Not all software comes with box and
instructions, but most do...ask when you call to order.
No, I do not work for them. I have, however, spent a lot of
money on items received from them (unfortunately, before the prices
dropped!) and am a satisfied customer. If you are looking for an 8-bit
item, it is a good idea to check with them before calling B&C or
BEST, which both have more extensive inventories but also MUCH higher
prices.
American Techna-Vision can be reached at 510/352-3787.

-Joe

40. For Sale - 8-Bit Atari Itmes

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-02 17:33:17 UTC
From: ussing@turtle.fisher.com
Message-ID: <1995Jan2.123317.1614@turtle.fisher.com>
Source record: 95780

I am now fully retiring my Atari system. Therefore, I am placing
this posting in this group to determine if there is any interest in
purchasing the Atari items. I would like to sell all of it together.
I have the following items:

Two Atari 800's - One known to be working the other worked
the last time it was on.
One Atari 800XL - Worked the last time it was on.
Two Atari 850's - One known to be working the other I don't
recall the last time it was used.
Two Atari 1050 disk drives - Both known to be working.
One or Two 410 tape units.
One Atari printer plotter device. I don't recall the number.
Various cables and such for connecting monitors, modems & such.
A bunch of game cartridges, basic cartridges, Atari Writer,
Editor Assembler and Print Shop, SynCalc and some other
diskette software.
Most of the original documentation for all of the above and
other information about the Atari systems.

I don't have a complete inventory. If interested respond via email
to this post. I do not read this group on a regular basis. I had
the system on over the holidays and reformatted most of the old
diskettes which will also be included. I could also include a printer
in the deal if interested.

I am posting this to determine if there is anyone that can get some
use out of this stuff. I just goes against my grain to throw out
things that are still working but somewhat out dated.

Dan Ussing

>GUI.

I like a command line, too (that's one reason I prefer SpartaDOS to MyDOS),
but you can have a command line within a GUI, even in Windows (try JPsoft's
Take Command).

>If I had a choice, I'd rather launch an application (like Norton, or
>WordPerfect) from the command line.

Me too.

> Why? Well, it starts instantly, has
>ALL the low 640k area plus the high mem to boogie in, without having to
>worry about sharing memory, etc.. with Windows.

None of that stuff has anything to do with the command line vs. GUI per se.
It has more to do with the multitasking and resulting memory management (or
lack thereof).

> All this clicking from
>icon to icon and switching back and forth is a pain when you want to begin
>and end an application then move to another FAST.

One advantage to multitasking is that you don't have to end one application
before beginning another -- you can keep them both alive and switch quickly
between the two, without waiting for startup and shutdown routines to do
their thing.

> Maybe that will change
>with Chicago, but the advantage a Mac has over the IBM platform is that it
>is in the FIRMWARE, not sharing memory and being OVERHEAD.

And the advantage the PC (no longer merely IBM) platform has over the Mac
is that you're not stuck with the operating system the machine ships with.
You can change to something totally different.
That was also a feature of the XL/XE, but that RAM was usually used for
storage of some other sort, rather than OS replacement.

>Anyway, back to the original stuff.... the 8 bit was one of the most
>advanced computers for it's time because of the custom chips incorporated
>into the design. The cpu chip didn't have run the whole show. In addition,
>the disk drives had custom chips and were "smart", unline the IBM drives
>which had to be continually monitored by the cpu.

I believe PC drives are monitored by a controller, just like the Atari
drives. The difference is that the PC's drive controller controls multiple

drives and I/O ports, while in the Atari each drive has its own controller.
The Intel CPU talks to the controller, not to the drive.

[ST raves deleted]
>......if it had only been marketed more vigorously, the world would be
>using Ataris not IBM clones.

I've heard this many times in the Atari community, but I still don't believe it. The reason Intel-based PC's are dominant now is a combination of IBM's power a decade ago and it's decision to make the PC from parts anyone else could put together, including an outside (Microsoft) operating system. This turned out to be a bad decision from IBM's point of view (they're maybe third or fourth at best in Intel-based PC sales), but a great deal for Microsoft, since their OS could be run without modification or recompilation on the PCs of numerous manufacturers. Also good (but not quite as good) for Intel.

Apple, on the other hand, started small, became the dominant player in the 8-bit market through educational placement, then took Xerox PARC's ideas for a GUI before anyone else had on the mainstream market. They kept everything proprietary, and did PLENTY of marketing ("The Computer For the Rest of Us"), and now they hold a distant second place to the PC clones.

According to figures put out by Reuters yesterday, the Pc
leaders in 1994 were:

1. Compaq, with 4.83 million units shipped
2. IBM, with 4.23 million units shipped
3. Apple, with 4.13 million units shipped
4. Packard Bell, with 2.29 million units shipped
5. NEC with 1.71 million units shipped

So...

>Apple, on the other hand, started small, became the dominant player in the
>8-bit market through educational placement, then took Xerox PARC's ideas for

Apple is in third place, not second, in terms of units shipped.
If you meant as far as total number of people using the computers, then
you are correct, as they have a 10% marketshare, which is more than Atari,
Commodore or ayone else other than the MS-dOS/Windows makers can say.

What continues to amaze me is the way the IBM PC and clones (
hereafter refered to as the IBM PC, which includes all clones) killed
all the competition. I mean, Apple once enjoyed a HUGE marketshare,
back in the 8-bit era. Atari had a 24% marketshare at one time, which
is nothing to laugh at (and a larger share than Apple's current one!).
Commodore had great success in that era as well. Then, IBM comes along
with a less-capable, less-friendly, less nearly everything computer
with a crummy OS and poor graphics, and the IBM PC destroys all
competition!
It has been eleven years now since the notorious "1984" Mac
ad (well, as of the superbowl :), and Apple is STILL unable to get
the marketshare it deserves. As for Atari and Commodore, well, they
completely blew it even worse than Apple did.

Now, if you want to work in virtually any industry other than graphics or desktop publishing, knowledge of the Ms-DOS and/or Windows and IBM PC platform is mandatory. Most home computerists have an IBM PC on their desktop.
This wasn't a masterstroke of IBM's. They pretty much screwed themselves out of a lot of profits by using off-the-shelf componants and by farming out the OS creation job. While they have ridden the IBM PC tidalwave, others have done so as well, with better results (ie, Compaq).
What is horrifying is that, in making the choices they did, they have ended up choking off the viability of all other platforms. This has held true for quite a while now, but it may change in the future if the PowerPC ever gets shipped.
But, short of another paradigm shift in the Pc market, the IBM PC's legacy will continue.

Fortunately for those of us who make the Atari 8-bit our primary computer, this is all neither here nor there. :) Our platform is already officially "dead". :)

46. What is Omnimon? And DRAM for 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-02 21:31:46 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FADIBFVSUP@stingray.manawatu.gen.nz>
Source record: 95786

I figure that Omnimon is a monitor, but is it a cart ,or some kind of
replacement ROM that piggybacks or fully replaces the Atari one, or what?

And also, where's the cheapest place (pref. in Calif. or Oregon) to get
replacement DRAMs for an 800XL? They aren't so cheap in NZ.

I saw that posting that had a 600XL 64K ram pack for $13 or so - so I guess
at worst, I could buy one of these and remove the chips and install them in
my XL? Is that right? And do _all_ ram packs come with IC holders?

Richard.

PS. Is omnimon still available? If so, where, how much... ?

Dunno about cheapest....but they CAN be purchased from B&C
ComputerVisions for $15.00 for a set of 8 4164's (yielding 64K). Item
number ICG005. (408)986-9960.

>PS. Is omnimon still available? If so, where, how much... ?

Omnimon is still available at B&C. The 400/800 version is 29.95
at B&C, who carry the Ramrod XL/XE with Omnimon for $49.95, and the
RAMROD 800 w/Omnimon for $39.95.

But, I don't have a copy of every Atari vendor catalog/flyer, so
I have no idea if these are the best possible prices.

No idea. My suggestion is that you call B&C and ask whether they
are in the products they carry. Or call American Technavision and ask
about that 600XL 64K upgrade for $13....

Source record: 95798

For the heck of it, I've decided to pull my copy of Determ out of
plastic, and give it a try.

Cant imagine why its not more popular than Bobterm. I mean, it offers
all of Bobterms features (minus 80 column) PLUS much more:

1) SpartaDos command line
2) binary load option for those without SpartaDos
3) Batch up/downloads
4) CI$ Quick-B protocol
5) Buffer capture
6) Pull-down windows
7) Play "Breakout" game while up or downloading
8) More add-on modules than Bobterm
9) Instant onboard HELP screens

Anybody else out there using it again? Anybody have any idea
on how to create these add-on modules? I'd love to see an XEP80
add-on for 80 column usage!

>I always asked, "how can you see ERROR 1 if the power to the computer
>is not on???"

I have a copy of that book, and it does indeed list it.
It is in an Appendix. Page 329, "Error Messages". Here is a brief
quote from the book:

Errors will cause a message of the form:

"ERROR xx at LINE nnnn."

The error number ("xx" above) may be in the range of 1 to 199.

ERRNUM 1 ; POWER NOT ON

ERRNUM 2 ; MEMORY FULL

ERRNUM 3 ; VALUE ERROR

.. (it lists up to ERRNUM 21, then stops listing them for some
reason).

Very strange indeed. Any ideas why this would be in tere?
Er, there? It doesn't seem to be a typo. Strange.

54. How Atari Compuers Changed Our Lives

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-03 03:36:54 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <RCw6ADO.ransom22@delphi.com>
Source record: 95793

The Subject Heading above may look like the title to a cheap "B"
movie, but it is actually a prelude to a discussion I hope to have with all
who care to participate on the ways in which Atari compuers have changed
our lives.
You may wonder why I tend to post messages like this one. Qute
simply, it is because I find it infinitely interesting to read messages
from my fellow Atari Classic users who love their computers as much as
I love mine. Another reason is that I have been a SysOp for a long time,
so attempting to start conversations is a habit I can't break. :)

The greatest way in which Atari Classic computers changed my life
started when I first flicked the switch on my very first computer, an Atari
400.
The total system I owned was the 400 and a 410 Program Recorder,
both hooked up to my 13" TV. Strangely, I have a hard time pinpointing
the date I receieved this gift. It was before the 1200XL came out, of
that I am sure, as I later traded up to that system when it did
come out. It could not have been too much before that, however.
At any rate, that little 16K computer system altered my life
irrevokably. Prior to that time, I had been interested in reading
fiction, playing role-playing games, listening to AC/DC, and that was
about it. I did poorly in math classes. While I never failed, I
could not get out of the "C" grade range. I just wasn't interested
in it. I was in Junior High at the time.
The day I got the computer,I started messing around with Atari
BASIC. Within minutes, I had a colorful graphic display on the
screen (with the help of the "Atari BASIC: A Self-Teaching Guide" book).
Okay, it was just a Gr. 3 dot I plotted. But it felt as if I had
just written Pac-Man. :)
I spent weeks learning BASIC, trying different things, coming up
with short game programs. Every day after school, I went straight to my
room and turned on the computer. Each weekend wa spent typing in
programs. I was hooked!
Before I knew it, I was using algebraic equasions, whih had
been an enigma for me until then. My grades went up without my having
to work at it. (Programming wasn't work! It was play!)
A few years later, I took a Geometry class in High School.
It was a snap! Doing proofs was just like programming! And the
terminoligy and concepts of graphing were just like those used
in Atari BASIC when drawing in one of the graphics modes! I earned
an A a mathematics class for the first time in my life.
Finally, in college, I continud to get straight A's in all the
math courses, including Calculus and Statistics. I won't say I didn't
have to work at those, but I *know* I would never have been able to

do so well if it weren't for the Atari.

Now that I have shared one of my stories, I would love to hear some of yours.

-Joe

(R. Morris asks about Omnimon.)
Omnimon is an alternate OS chip that you can just plug into
your OS chip socket by itself, but doesn't support the PBI. For
this reason you would probably get RAMROD XL, which allows up
to three OSes plugged in and you pick which one you want with
a switch before power up. I think it would be derelict not
to mention that the Black Box from CSS has what I imagine
to be the best ml monitor available for us. I've never seen it
but for pretty substantial bucks, you get the BB interface,
rs232, printer port, hard drive interface super speedy io
and I think a US+ OS and the monitor. A pile of stuff.
I may be wrong about that OS coming with it.

I agree completly, until my Omni died (it is being repaired) I never
realized how much I leaned on it. It really makes the 800 much eaiser to use.
By the way;
1) the example I gave earlier was taken directly from the Omnimon docs for
making a file of the basic cartridge, almost verbatim. I even did it once
just to get the hang of using the cart.
2) Yes, I know it only works with a 400/800 os, that is what the gentleman
said he was using!
3) Why is the JSR to $F3F6 (not $F3F5) illegal?

I am not know nor ever have been a programmer. I never took one CS course at UC Berkeley, my experience with computers was limited to sneaking into Evans Hall at 1:00am and logging on to my friends VAX account to play Original Adventure and Star Trek. Then my best friend, a team mate on the Gymnastics team, talked me into going in with him to buy an Atari 400 and an 810 drive. I was fascinated with it and desperatley wanted to program the thing. He threw the Basic Reference manual at me and said read it, that's all the instruction I got. My first job was to port over a basic program from a TRS-80 for designing spaeker enclosures and I don't kow how, but I did it. I was hooked.
After he graduated and moved back to Canada, (and took the 810, I got the 400) I was left on my own. I got a 410 recorder and a MPP modem (300 baud) and kept going, typing in magazine articles, eventually got a disk drive (a percom AT-88, $499!!!) and then an 800 that I still use daily.Along the way I got into hacking up the innards of the 800 with a Ramrod, Omnimon, Omniview, Integator, Corvus 7meg HD, a Happy 810, and on and on... I have always loved to tinker. I became a computer junkie in the early days, all night hack sessions working on games or debuging type in programs or all nighters with Star Raiders and Krazy Shoot-out (ever been to sector 7? Hell on earth.) I now run a small BBS for the Northern Calif. Women's Gymnastics Association (on a PC, yeechh) and still spend the majority of my tube time in front of the old 800. The world of knowledge that the Atari has opened up for me has been a constant source of pleasure for me and thanks to this group is better than ever. I now have a MAJOR hobby that I would never have even thought of pursuing earlier in my life. The Atari changed that. It definitely opened up a whole new world to me.
Now if I could just get my hands on a MARS8.....

DeTerm is pretty cool, I must agree... but I don't think it supports high
speed data rates (9600, 19.2k).

As for some of the features you listed, let's see.. :)

1) SpartaDOS command line - no, BobTerm doesn't I don't think
2) Binary load option - obviously <heh>, so that's not a 'feature' of
DeTerm over BobTerm
3) Batch Up/Downloads - BobTerm does do this. Y-modem (at least)
4) Buffer Capture - Yes, BobTerm does capture to a file buffer.. no
scrollback though if that's what you mean
5) Oopps.. shoulda been 4: CI$ download - I don't remember.. no?
6) Pull-down's - No, but no data loss when you're in any of the menu
screens (term. screen is still updated in background)
7) Breakout - No, only DeTerm has that. Is the later versions of
Ice-T or FlickerTerm going to have games? Hmm.. idea's
becoming limitless here! :) :) :) .. oh, sorry. :)
8) "More add-on modules" - Yeah, I think DeTerm does beat BobTerm.
What Add-on's ARE there for BobTerm?
CGS graphics is all I know of.. now CGS
is its own terminal!

9) Help - Yeah, again, DeTerm beats most when it comes to this too.

Oh well.. anyways, .. as long as I've cleared some of it up, I feel
better for us BobTerm users.. But we all know where the future is...
FT80 and IceT! :)

Okay, I'm a bit behind with this because of the Christmas hols.

I once had a pirate copy of International Karate which contained no sound (I have since reformed). The fact that Computer + Video Games magazine's Atari 8-bit
review version had no sound either got me a bit suspicious. Who was ripping it off? I've also seen pirates of The Last Starfighter and someone once wrote in to Page 6 claiming that they had copies of Elite and The Last Ninja.

It seems to me that the software companies at the time were pretty much helping the pirates help themselves if the number of pre-release versions that got ripped off is anything to go by.

66. Wizard of Wor on XL, XE?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-03 13:02:16 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.1389.2F094AD8@getty.onu.edu>
Source record: 95806

I remember playing this game on my cousin's old Atari at least 5 years ago, and maybe on the 5200 around 10 years ago with a friend. I have been hoping that it would come out for the IBM or on Sega Genesis or Super Nintendo, or Jaguar for some time, but it doesn't look like that's going to happen. I was considering buying the arcade game itself, because I loved it, and probably pumped at least 5 times as many quarters into Wizard of Wor at the arcade than I did any other game. (even Ms. Pac-Man, which was my 2nd favorite) Maybe it was the 2-player capability that made the game fun, I don't know. I still had a great time playing by myself.
Anyway, I was wondering if there is any difference between the cartridge and disk versions of this game, and if anyone out there knows of a clone that has been made for the IBM PC. I really appreciate any info you might have!

Omnimon is a replacement OS chip which provides an excellent m/l monitor.
I believe FTe holds the rights; there are versions for the 400/800 as well
as for the xl/xe line. There's also Omniview, which provides 80 columns
on screen (via a GR.8 screen). Check the dealers list for contact info.

The reason the world is still going clone is that instead of pockets of hobbyists, they were becoming more and more popular both at home and especially at work as mainframes were giving way to PC networks.

Just as VHS beat out BETA as the rental and commercial tape business demanded one winner, there became a need for 'compatibility' within the computer industry.

Unfortunately the Intel CPU and MS-DOS became the standard method by which computer using is done in this country and once a standard appears, it is almost impossible to change. Just look at our hopelessly outdated phone lines for instance, over 100 years old and FINALLY the stirrings towards an alternative (ISDN/superhighway cable) are growing.

In the 8-bit era, you didn't have the kind of integration of personal computers in the workplace. People were still using electric typewriters at work. They went home and tinkered with their home computer. They were not as concerned with passing spreadsheet or WP files back and forth between businesses...

So IBM and Microsoft were simply there at the right place and the right time, and the uneducated business executives were far more likely to go with something boring and tried and true (IBM) than to go with something more innovative like the 68K series machines.

It is only by virtue of the qualities that the ST and Amiga had that they were able to be considered mainstream for as long as they did. For a time, the ST was earning a bit of development from the same big companies that did PC software. This was even more so with the Amiga. After all, Microsoft developed their Basic (not very good by the way) and they have a few versions of Wordperfect I believe. And of course a shitload of game ports...

The MAC survived by virtue of its yuppie appeal and the greater resources of its parent company which allowed them to advertise more vigorously, not to mention much better distribution. I mean, jeez. Atari and C= distribution channels just plain SUCKED. After 1987 you had to really look hard to find places that sold those machines outside of mailorder. (I'm speaking of the 16 bit machines, their 8-bit machines were still in TOY stores--yeck).

Now, after 10 years or so of the stifling effects of MS-DOS, the end is near. 10 years is an aeon in computer terms. And MS-DOS was already showing its inadequacies in 1985. It has come to the point where the need for productivity is FORCING more open-mindedness on the part of the business community to consider new operating systems.

But the only way they will consider this, is if they can run their old software in emulation. Hence RISC machines.

The old system was that a change in operating system usually meant losing compatibility with the other system, either due to having to change archetectures entirely, or by having to install a whole new OS in your machine and then only being able to exchange data in very inconvenient ways between OSs. The only reason that there is a good chance that a new operating system will become standard is that the machines have advanced enough that portability of operating systems (Windows NT) and flexibility in the OS to emulate CISC, is allowing the new machines to absorb the past and to move forward with a clean slate.

This has meant, unfortunately, a good decade or so of lost time as far as establishing preemtive multitasking in the 'standard' operating system, but that's the way it's been.

But we certainly aren't there yet, and despite the fact that Microsoft created NT, they obviously don't want to see MS-DOS/Windows to go under yet, hence Win95/Chicago. This and the Pentium are two big stalling tactics which have done nothing but prevent the inevitable--the death of the computer status-quo as we know it.

With the power of Intel and Microsoft, the move to RISC can be hindered for years if they want to continue fighting it. But at least IBM and Motorola have the right idea in working together to try to see us to a new start with PPC. IBM knows that Microsoft is a monster they created and in the long run, IBM has to establish its own identity, which it first started with OS/2 and now with the PPC project. Feeding off the success of Microsoft is not a position that IBM feels happy about I'm sure.

The moral of the story is that the days when you could just buy a computer based on its individual performance are over. Some people will continue to do that, which is why we will have a tiny niche market for things like the new Amiga models (whenever they are released) and of course the larger niche market of the MACs. Those who follow that route will face the usual snickers and puzzled responses by others, which is more than enough peer pressure to force most into buying what everyone else does. But we MUST appreciate the way computers have become an extension of our lives to the point where 'standards' to ease communication have led to the homogenous world of clones we have today. We have only PCs today, and the unwashed masses always expect that a program on their computer can be taken to your place and run on theirs just as much as their VHS tapes will run on your VCR. If it doesn't, then it is YOUR problem for not conforming to the norm and you are ostracized.

FTP to "atari.archive.umich.edu" (or "amiga.archive.umich.edu", or "mac.",
or "msdos.", or who knows what else).

Change Directory to "atari/8bit/Xf2" and download a copy of "xf25.zip" or
"xf255.zip" and some of the other programs there. (I dunno if xf255.zip
even exists, BTW).

As for "disk images of Atari titles for your PC", well, with PC Xformer,
you don't NEED disk images. You can make them yourself. Just get blank
copies and run it like this:

C:\PCXF> XF25 MYDOS.ATR GAMES.ATR SPACE.COM

Where "C:\PCXF>" is whatever your DOS prompt would be at the time,
"XF25" is the name of the PC Xformer 2.5 executable, "MYDOS.ATR" is a
bootable disk image (in this case, probably containing MyDOS), "GAMES.ATR"
is a disk image with some free space on it, and "SPACE.COM" is the new game
you just downloaded and unARCd and want to add to your collection of
games in that "GAMES" disk image. (Again, which you make out of a blank
disk image.)

Then, from MyDOS, copy "D3:SPACE.COM" onto "D2:" and voila, you have
a copy of SPACE.COM on your GAMES disk image. Now you can delete the
copy of it on your PC's drives ("DEL SPACE.COM") because you have the
other copy sitting on that GAMES image.

Good luck! Have fun!

From: bbaker@cs.utah.edu
Message-ID: <3ecphb$n09@magus.cs.utah.edu>
Source record: 95830

I'm just wondering if anyone knows of an emulator for the Commodore VIC-20 and/or C=64/128. Don't they both use the 6502 microprocessor like the Atari? Shouldn't this make it easier? The reason I'm asking is that I have some old VIC-20 and C=64 software. It just basically sits in boxes most of the time because I have so much more software on my 800XL. Also, the C=128 died (The VIC still works, though ... Go figure). If anyone has ever heard of such an emulator, I would greatly appreciate a reference to it.

Ben

Try American Techna-Vision at 1-510-352-3787

American Techna-Vision
15338 Inverness St.
San Leandro, CA 94579

They have 16K RAM Memory Modules for the 800/400 for only $4.95 a piece!
Part number is CX853 and the Catalog # is A201. These memory modules have
heavy duty gold plated connectors.

Get two of them and you will have a total of 48K RAM for your 80!

There is room for three 16K RAM modules in the 800.

Hope this helps.

You asked what programs make possible the reading of the atari
disk in the pc.
Util and SpartaRead (pc programs) do this for DD disks and Mule
does it for 1050 enhanced dens. disks but the software is for both
the pc and the atari cuz

its much more difficult to read.
You can get all these programs from the atari.archive.umich.edu.

>the computer status-quo as we know it.

This is the only part I don't quite agree with.
Windows NT is a lot more like Windows 3.1 than Win95 is, is many different ways. Win95 is definitely a step in the right direction, while NT is just 32-bit 3.1. I believe that MS is keeping the NT/server line separate from the mainstream Windows line (Win3.1, Win95) because most people (especially those of us that hang around in c.s.a.8!) don't want to have to buy a 12 meg machine just to run a decent OS, when their 4 meg machine runs all their current software just fine. (MS will Chicago-ize NT after they get Win95 out the door.)
Similarly, the Pentium is one step in the RISC direction; it has many advantages of RISC, but it still runs all the old software without emulators, and it's more affordable than most RISC processors. I've heard that Intel is planning for their 'flagship' processor to be all RISC by the time they get to the "P7".
People don't like change, so you have to do things like that gradually. Rather than stalling tactics, these are evolutionary tactics, as opposed to revolutionary tactics which are much more risky in the marketplace. The PC-clone market has kept its huge dominance because the major players have for the most part chosen evolutionary tactics over revolutionary tactics. The revolutionary ideas either die or have a hard time catching up with what's established.

MS and Intel aren't the ones stalling "the death of the computer status quo", the many users out there with their old software and old knowledge are -- they don't want to switch. (Where I work they haven't upgraded their software since MS-DOS 5 and Windows 3.0!) I'm sure MS and Intel would love to put out the most advanced products they can think of, but the average user wouldn't buy them if they can't run all their old software better and easier than the current stuff.
And who are we to talk about killing the status quo, when we're still using 10-15 year old 8-bit computers? Don't tell me you don't still use your old 1980s programs. :-)

83. SpartaDos Filenames?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-04 05:48:02 UTC
From: Michael.Fitzpatrick@flight.org
Message-ID: <e4f_9501041226@flight.org>
Source record: 95827

```
The cartridge is Sparta X v4.21.
There are two disk based Sparta Doses:

1. X32f.DOS by Fine Tuned Engineering
2. X33A. By Fine Tuned Engineering and K-Products. I'm not 100% sure on
that as it is being beta tested and has a partial release as shareware. It is
supposed to support BBS Express Pro.

Hope that helps.

84. Great Luck selling 8 bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-04 06:38:20 UTC
From: chipdancer@aol.com
Message-ID: <3edfos$4g6@newsbf02.news.aol.com>
Source record: 95844

Thanks to this wonderful newsgroup, I have been able to sell almost all my
8 bit equipment and software. I am so happy that my old games are now
being enjoyed in Japan (he's hooked on Jumpman), and the various pieces of
hardware have new homes all over the U.S.
Thank you all, and Happy New Year!

The "mystery" bus is small bus on the back of the 800 motherboard, unused by
anyone and in all probability used for testing the computers at the factory
at the end of assembly. I still wonder at the possibilities of that little
dodad.

Damn. If Star Raiders 2000 was developed and was good, I might
buy a JAG just for that game. I guess I'm dreaming.....

Please Atari - don't desecrate the Star Raiders name with a
half-ass game like "The Last Starfighter" being called "Star Raiders II"
in 1985.

I for another am ***VERY*** interested in seeing a way that my
aging collection of ORIGINAL protected Atari software can be BACKED UP to
my PC's hard drive. I agree with someone else on the net who said that
as soon as his original MULE goes, so does he.

Mr. Kendrick - relieve your mind of piracy for a brief interlude
and recognize that the legitimate problem exists. Sure enough, SOMEONE
SOMEWHERE will pirate anyway.... If I was able to BACK UP my original
software via SIO2PC and someone was to pirate MULE (which would indeed
be a crime, yes) what would the consequences be? Do you suppose it would
hurt Electronic Arts sales of a product off the market for ten years??

James Wood

(Reply to James Wood)

Hey! I said nothing of pirating! I was just sticking my own SIO2PC ideas into the thread and stating that I personally would rather see better PC interfacing than a disk backup option or util. added! :) But, these are MY priorities!

And of COURSE someone's gonna pirate! :) Name a computer platform (with disk or tape drives) which HASN'T had pirating!?

89. Atari Cartridges & Pill

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-04 10:10:49 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3eds79$2bt@usenet.INS.CWRU.Edu>
Source record: 95832

This article is a reply to articles on cartridges and the PILL:

In response to the description of the PILL, that is so simple
I wish I could have thought of that. It looks like the 7400
is used as an inverted and which the switch is closed, whenever
the r/~w line goes low it pulls RD4 and RD5 (as labeled in
Mapping the Atari Revised Edition.) making the computer circuitry
think a cartridge is installed suppressing the write to RAM.
I would think RD4 and RD5 should be tied together on the same
side of the switch - I am not sure if this was implied in the
original post. If you build this into the computer instead of
a cartridge, perhaps a double pole switch should be used since
you don't want RD4 and RD5 connected. This won't solve the
problem of running cartrdiges on XFormer. All we need to run
8K and 16K on XFormer is support for 8K and 16K Rom Images.
I suppose XFormer could support OSS, Atari, and other Banked
cartridges if I file format could be developed. OSS carts use
the CCTL line to control the cartridge where Atari carts use a
memory adress. I believe atari's banked carts consume 16K with
the lower 8K banked, where OSS carts use 8K with the lower 4K
banked. I could provide a program to write out cartridge data
to a disk file. I even modified it to write out data from an
atari banked cartridge and was able to get BALLBLAZER to load
from disk (It only banks because of the title screen). My
cartridge slot has been flaky for years and I have never wanted
to unsolder the 30 pins to replace it.

To load a cartridge, you need a routine to lower ramtop to 32768,
close and reopen E: on channel 0. It helps to zero out some RAM
locations since some cartridges may assume some RAM areas to
be clear. Call the cartridge Init Vector, then the RUn vector.
(Most cartridges INIT address just points to a RTS). IF the
cartridge is protected it will more than likely not work. If the
modification described above and in another post were used, you
could print a message to flip the switch, before initializing and
running the cartridge then the ATARI should treat it as ROM.

The program to write out the cartridge requires you to carefully
insert a cartridge with the power on (as most others do). This
can be very tricky and can crash the computer more than not.
A lot of older cartridges allow a cassete boot, so you could
probably load a routine from cassete and write it out to sectors
on a blank disk (which would not require DOS). I think ATARI later
caught this trick.

cp576@cleveland.freenet.edu

just my 2 cents

92. Atari 400 power supply query

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-04 18:16:10 UTC
From: vsp@unix3.netaxs.com
Message-ID: <3eeola$pqv@netaxs.com>
Source record: 95829

I received an Atari 400 in the mail today (thanx Steve), sans power supply.
After rummaging through my assorted transformers, I found only one with
a plug that fit the 400's power jack, labeled OUTPUT: 9VAC 555mA.

The FAQ's power supply info had as its lowest power for the 400 the #C014319
with 9VAC 1.7A, so I had my doubts, but I plugged this one in and it
worked! (As well as it works without any carts plugged into it, anyway.
It was a pretty plain blue screen.)

When I pressed System Reset, I heard a little 'pop' or 'click'.

Will this transformer (obviously not a standard Atari one, it came with
an old 2400b modem) be sufficient to power the 400 over the long run
while I search for a standard power supply, and could the combination
do damage to either the transformer or the computer?

jeff. next quest: some 8-bit carts... back to the
FAQ, to see what works with this baby.

Good message there, Glenn. However there's a couple things I wonder about:

On 3 Jan 1995, Glenn M. Saunders wrote:

>
> Unfortunately the Intel CPU and MS-DOS became the standard method by
> which computer using is done in this country and once a standard appears,
> it is almost impossible to change.

While I accept that many people don't like the Intel/MS-DOS machines, I wouldn't go so far as to say "unfortunately." Personally, I don't feel that today's MS-DOS machines, which, while imperfect, can do a hell of lot, and notably cheaper than any 68K machine. I don't find the biggest bargains EVER in computing to be unfortunate.

>
> So IBM and Microsoft were simply there at the right place and the right
> time, and the uneducated business executives were far more likely to go
> with something boring and tried and true (IBM) than to go with something
> more innovative like the 68K series machines.

True, there was a time when the 68K machines were all better than the Intel. However, in the beginning (1981) there were no 68K machines, so they were not an option. Innovation in the 68K machines was never compelling enough to cause MS-DOS users to dump their hard/software. Instead, additions/refinements to the MS-DOS machines filled the void to the point that eventually the 68K machines were no longer more innovative - but rather outmoded.

> shitload of game ports...

Could the ST *ever* have been considered "mainstream?" The Mac, by far the most popular 68K machine, perhaps. The ST was such a fantastic machine in 1985 - but Atari's YEARS of resting on its laurels doomed the ST from the start.

>

Of course, the Mac Plus, Mac SE 30, Macintosh II, and so many
other variations up to 68040 generated sustaining enthusiasm for Macs....
Atari? Not a damn thing for years. Amiga? At least they got the
A4000. Apple's advertising helped, but corporate Apple kept cranking out
the next generation machines and kept things alive. C= a distant second,
Atari dead last. That had something to do with it as well.

>
> Now, after 10 years or so of the stifling effects of MS-DOS, the end is

> showing its inadequacies in 1985. It has come to the point where the
> need for productivity is FORCING more open-mindedness on the part of the
> business community to consider new operating systems.

I must admit that I'll be glad to see MS-DOS go, but one cannot
argue that despite all its inadequacies, MS-DOS can still get the job
done. I see many technically-minded yahoos belittle MS-DOS with some
high-powered analysis.... However, I can still turn on my MS-DOS
computer, click my mouse, and the job still gets done - probably as good
(that is - with quality software, fast, easy, and relatively cheap) as
other machines.

Some old solutions still work. Take automobiles... I'm tired of
reading a performance comparison between the Chevrolet Corvette or Camaro
and some of the new Jap turbo cars. Sure, there's no turbo, no overhead
cams, etc. on the 350. However, the LT1 350 cranks out equivalent or
MORE horsepower, and MORE torque. It costs LESS money and is more
reliable. Yet technically-minded yahoo writers continually belittle it
by calling it an "ancient pushrod engine" or "only having two valves per
cylinder." They complain about the "ancient solid rear axle." However -
a $19,000 1993-up Z-28 can pull as many g's as cars costing many times as
much. Same can be said for acceleration. Tops out just a hair under
160MPH. So the small-block is old.....so what?? It still manages to
get the job done. MS-DOS is also old. It is NOT state of the art, but
it DOES manage to get the job done at a good price. However, the
technically-minded yahoos will belittle both from here to eternity.

> But we certainly aren't there yet, and despite the fact that Microsoft
> created NT, they obviously don't want to see MS-DOS/Windows to go under
> yet, hence Win95/Chicago. This and the Pentium are two big stalling
> tactics which have done nothing but prevent the inevitable--the death of
> the computer status-quo as we know it.

The Pentim may not be the thoretical end-all, be-all chip.
(Hopefully we're talking about a new, improved one...heh). However, I
would NOT call it a "stalling tactic." It's a step up from the 486, is
it not? If the Pentium is a stalling tactic, then could not the same be
said for the 486, 386, or even 286?

>

I'm out for fun and loyal to none - when it comes to computers,
which is why I have a clone. With hundreds of hardware vendors for the
PC, competition between vendors has resulted in continued innovation,
massive selection, and low price. The same can be said for software. As
soon as the same can be said for ANY RISC design, then it's time to move
to RISC. I'll be glad to shitcan my MS-DOS machines then....but until
then, they continue to serve pretty well. In the meantime, I'll suffice
with what I have (486/66) and obtain a Pentium when the motherboards cost
only $300 - as they always come down to that price eventually.

Those who follow that route will be doing so out of preference,
NOT performance. Things have changed a lot since 1985. They can still
buy a computer based on its performance - a 486SX/25 or Macintosh
Performa 650 versus a Pentium 100Mhz or Power Mac.

As far as peer pressure - I'd say its those hundreds of competing
hard/software vendors which have attracted people into "buying what
everyone else does" and driven prices down so that everyone can afford
one. This point can be illustrated by comparing a $1200 486/66 system
with a $3000 Atari TT - then hunting for software for either. The TT
user based his choice on preference, not performance.

Taking computer programs from my place to another and running
them is MORE than an expectation of the UNWASHED! It's the way things
SHOULD BE, and it's about time things got that way, regardless of
architecture.

Rob Funk (rfunk@magnus.acs.ohio-state.edu) wrote:
: This is the only part I don't quite agree with.
: Windows NT is a lot more like Windows 3.1 than Win95 is, is many different
: ways. Win95 is definitely a step in the right direction, while NT is just

Well, I admit, I have not been studying the differences. All I know is that WinNT can be used on a wider array of CPUs. For instance, it is being used currently on MIPS boxes. I know that because there is a Lightwave port for it. It isn't tied to the Intel CPUs and this is good. Win95 looks just as tied to the x86 series as any other Microsoft OS to me, and that, to me, does NOT spell progress because the stifling of the computer industry is just as much a factor of the long-in-the-tooth survival of a CPU series that was never the best even 10 years ago.

I do feel that the huge overhead which NT requires is bad, but Windows isn't exactly that much better, it may leave you memory, but that's just because it is thrashing the drive with virtual memory swaps. NT is overkill for the average consumer, but just about every RISC operating system is overly bloated. I know of none that really offer a choice in how far you go in your implementation. Some of the features the average guy is never going to use, but it is eating up his resources anyway. I am merely talking about the lesser of many evils. Hopefully something better than NT will come around but that is all I could point to.

Theoretically, you could probably design a RISC OS that is really nice and in its base implementation, resides in ROM. The Acorn with the Arm (ala 3DO) is like that. It's not a perfect machine by any stretch of the imagination, but yes, there is no reason for requiring NT-like resources. For CISC machines, Amiga OS takes up 512K ROM and probably just a few hundred K in diskloaded stuff and the only thing it is lacking really as an OS is memory protection. When you move to RISC there is some code bloat anyway, but still, 2 megabytes at the utmost for a nice solid OS is all you really need.

: MS and Intel aren't the ones stalling "the death of the computer status quo",
: the many users out there with their old software and old knowledge are -- they

This is a philosophical debate as to the chicken and the egg. You see, where did the users get the idea that MS-DOS/Windows was all they needed? Where did they get the idea that preemptive multitasking was 'new' when OS/2 came out? Where did they get the idea that segmented memory and mega-kluge banking was in any way acceptable or state-of-the-art? They are almost totally ignorant of computers to the point where they have been hand-fed the BS that people like MS and Intel spew out, and they have been doing this for so long that they are almost hopelessly brain-dead.

It's not just the average joe, it's the press too. I saw a CNN article on the Pentium bug that referred to the Pentium as the 'Fastest chip in the world'. Anyone who knows anything about computers would realize that the fastest consumer level CPU is not THE fastest in all of computerdom anymore than a corvette is the fastest car in the world vs. the fastest street-legal car.

James Wood (jamesw@CSOS.ORST.EDU) wrote:
: While I accept that many people don't like the Intel/MS-DOS
: machines, I wouldn't go so far as to say "unfortunately." Personally, I
: don't feel that today's MS-DOS machines, which, while imperfect, can do a
: hell of lot, and notably cheaper than any 68K machine. I don't find the
: biggest bargains EVER in computing to be unfortunate.

First of all, since I am speaking in an Atari newsgroup, I don't believe it would be wrong to say "unfortunately" since I'm sure many of the Atari faithful would have liked the ST (or if they were primarily Jay Miner fans, the Amiga) to have won out and so even if they have clones, I'm sure most would have liked things to go differently. But yes, I was also speaking of the stifling of computer progress in general, if that's what you are riled about.

I do not seek to invalidate the opinions of those who chose to purchase a clone. Obviously they saw merit in being part of the mainstream. On the contrary, a great deal of my post was trying to explain why people like you HAVE clones. However, despite the advantages to owning clones, there are clear and distinct disadvantages. You may have the biggest bargain, but you do not have the best archetecture nor is the most popular OS for them in any way the most powerful, and that is just a fact. If that doesn't affect you in any perceivable way, that's fine. But if it were such that clones were both cheap AND the best machines ever created, there would BE NO DISSENT on the road to conformity. I mean, hell, that would be a utopia, so why fight it? But it isn't, which is why there are any people at all with 68K or RISC machines.

I don't want to get too far into Amiga advocacy here, but every time I boot up my A1200 I am reminded of its superiority to an MS-DOS/Windows environment, from the very liberal filename system which handles spaces and up to 32 characters, to its preemptive multitasking, datatypes, Arexx interprocess communication, more advanced shell script language, and on and on. If there was no advantage in using an Amiga I would not have considered getting one. Although I am not an ST/GEM nor a MAC/Sys 7.x advocate (I personally believe that both the Atari8 and the Amiga were the best machines of their eras), I do respect what must be an equal appreciation they have for the uniqueness of their systems and whatever advantages they think they have over clones.

: Taking computer programs from my place to another and running
: them is MORE than an expectation of the UNWASHED! It's the way things
: SHOULD BE, and it's about time things got that way, regardless of
: architecture.

Unrealistic an expectation it is, plain and simple. Out of the milions of people with computers, one can not expect or dictate that they run the same operating system. What would be convenient for you and the majority would be fascism to the minority. Thankfully there ARE ways to exchange DATA between dissimilar computers. From something like the MS-DOS disk conversion stuff on my Black Box/Floppy Board, Jview XL for foreign graphics formats, various low-level database and spreadsheet conversions on the Atari8, and CrossDOS, Emplant, and a shitload of WP/DB/graphics/etc.. conversions for the Amiga. If using another computer meant being TOTALLY isolated then it would be too intolerable even for the nonconformist to endure.

For some reason I fear that you are so sensitive as to ignore my comments which respect the opinions of clone users and focus only on my valid characterization of the 'clone wars' (pun intended--for Star Wars fans) as being a dark-age for operating system evolution in the mainstream--despite the good of the proliferation of computers in general.

Do you know how stupid business is???????????

I used to work as a temp at Bank of Boston. They have a network of 486s hooked up to a huge fileserver. If you want to see first hand how Clone boxes SUCK SHIT, then just come on down and ask for a tour of the returns department. Most of the 486s there are DX/33s, and some are newer and faster. Most of them have about 8 megs RAM.

First of all, the software is ancient. Maybe close to a decade old, but it may be revised or something, but still, it is a DOS app they are using. The machines are mostly running DOS 5.0 and some have Windows in them, but Windows is never used because the old app runs in DOS so why bother?

The software is so bad that you have a dearth of editing or undo flexibility. On all the fields, you can enter data, you can destructively delete, but you can't use the arrow keys to go back and insert text. This is basic shit folks! Most Atari8 applications allow that kind of stuff! There are also a lot of places where you 'pass the point of no return'. There is almost no ability to edit out mistakes short of deleting records or a whole session's worth of work. This slows down productivity like you wouldn't believe when someone presses one wrong key!

What about multitasking? MULTITASKING?? These machines have no idea what that is. One of the stations is tied up for a good hour a day or more printing out reports. If it could only MULTITASK, you could switch a window, and the terminal would be freed up for more inputting. But no. There were several times where we were short terminals (and you know how banks are about being stingy about buying new equipment) and if only MS-DOS had the ability to multitask effectively, that terminal would have been free for more inputting.

Of course, that may be moot if it would have slowed the throughput to a crawl, and on the one 386/16 we have there, that machine does achingly slow TEXT MODE screen updates. It's like it is writing to the screen as if it is a vt100 terminal istead of something memory-mapped.

After each batch is inputted, you have to total it up to print, on the 386/16 it just LABORS and LABORS at it. This is simple number-crunching that PCs are supposed to be famous for, right? If you threw a nicely written piece of 68K software in there with 68030/16s it would probably blow the roof off the place.

To make worse, the network (and you know how clone advocates love to wax on about how great their machines are in business networks) is ALWAYS flaking out or going down entirely. Sometimes you can't print through it, et cetera...

THAT is my firsthand definition of the evils of Microsoft and Intel.

As for dumping carts to disk,

I noticed that the start button is checked before the cart is started,
so surely you could dump the contents of the cart to cassette and then
load the cassette file back into disk and play around with it to get it
to run? This would eliminate having to buy a cart copier, or putting
the cart into the right socket (bit hard to do this on an XL or XE).

I tried it once on my missile command cart several years ago, and although
it didn't work when I loaded it from disk (I forgot to lower the memory and
sort out a few other things normally done by the OS), the data was there
correctly.

Just thought this might help someone out there that wanted to do this. I
guess in conjunction with what everyone else has said, you should be able
to copy carts this way.

Summary of Atari 8-bit's an emulated 8-bit Atari's:
Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:
400 - 16K, 400/800 OS, CTIA graphics
800 - 16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
600XL - 16K, XL OS, GTIA graphics
```

800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XE OS, GTIA graphics (XE OS is same as XL OS?)
130XE - 128K, XE OS, GTIA graphics w/ Freddy (for graphics banking)
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (OS had missile cmd)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can
be purchased on cartridge for the 400/800/1200XL's.
ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines.
Very limited. Now public domain.
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited
and supports only 800 OS. Both public domain.
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K
RAM, and best of all, player/missile collision detection (which MANY
games use!)
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen
modes are available.
Screen modes can be mixed (by lines) down the screen using the Display
List (a program which is executed by the ANTIC graphics chip every
screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.
All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection (which
is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).
Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:
At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten, well, fed up with the XF2-based questions which did not pertain to them, or to the really dumb questions which were in fact understandable to new or rusty Atari 8-bit users, but had just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.
A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to

the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)

[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a

disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN
that normal directory, or even another subdirectory. For example,
you can have your disk divided up into the "GAMES" files, the
"GRAPHICS" files and the "SOUNDS" files. A directory of the disk
(the "root" or "base" or "trunk" directory) will simply list the
three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then,
if you ask for a directory listing of the "GAMES" subdirectory,
you will see the files (and perhaps other subdirectories) within
the "GAMES" directory. Think of it as a tree. For people familiar
with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also

have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating
System but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler which
runs in the background and accepts input from either a mouse,
a joystick or a touch-tablet and displays a mouse pointer on
the screen.
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.

W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of today, 7/23/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings

are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character

appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)

CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?
/-----\
[note:] Someone please give more details or corrections here! Thanx!
\-----/
A.1.1) If you have double-density Atari disks, you can use the program

"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to

look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:
B&C Computervisions (USA):
1-408-986-9960

Mid Cities Computers (USA):
1-310-867-0626

The PC Xformer 3.0 may be useless for you, for the moment, IF you can't live with the fine PC/Freeware/Shareware titles out there, available for FTP!

I suggest dig around Umich (atari.archive.umich.edu ; atari/8bit) for some titiles (under "Games" directory). It's a bit small in comparison to all of the commercial software out there, but some of the quality is well worth the lack of quantity (how many of us REALLY want all of the old early 80's titles which don't barely tap the abilities of the 8-bit!).

If you just can't STAND it, go purchase an Atari 800XL or 65XE or 130XE used or refurbished (although used from other 'net users is usually far cheaper compared to used, new, or refurbished from larger vendors) and an Atari 1050 or XF551 disk drive and get full compatibility! (Copy-protected software will run for the first part; all other software would work for the second part! (hey, PCXF30 isn't perfect.. hopefully some future 3.x or 4.x or 5.x version will be! :)))

Good luck!

Glenn M. Saunders (krishna@max.tiac.net) wrote:

: Do you know how stupid business is???????????

This part I'll buy...

: I used to work as a temp at Bank of Boston. They have a network of 486s
: hooked up to a huge fileserver. If you want to see first hand how Clone
: boxes SUCK SHIT, then just come on down and ask for a tour of the returns
: department. Most of the 486s there are DX/33s, and some are newer and
: faster. Most of them have about 8 megs RAM.

I must've missed the relevant part here. Is it bad because they're
reasonably powerful processors stuck in shitty motherboards? Or that
this returned hardware goes to waste?? I'm lost.

: First of all, the software is ancient. Maybe close to a decade old, but
: it may be revised or something, but still, it is a DOS app they are
: using. The machines are mostly running DOS 5.0 and some have Windows in
: them, but Windows is never used because the old app runs in DOS so why
: bother?

Yeah, good point. God knows, if you've got a GUI to bog shit down, by
all means, slap it on top of software that doesn't need it.

: The software is so bad that you have a dearth of editing or undo
: flexibility. On all the fields, you can enter data, you can destructively
: delete, but you can't use the arrow keys to go back and insert text. This
: is basic shit folks! Most Atari8 applications allow that kind of stuff!

I'll sure buy that. The programmer(s) should be shot, hung, drawn,
quartered, whipped, boiled, and forced to read comp.sys.amiga.advocacy...

: What about multitasking? MULTITASKING?? These machines have no idea
: what that is. One of the stations is tied up for a good hour a day or
: more printing out reports. If it could only MULTITASK, you could switch
: a window, and the terminal would be freed up for more inputting. But

Which would certainly be the case if it were running OS/2 or another
relatively modern O.S. DOS 5.0 certainly doesn't qualify.

: Of course, that may be moot if it would have slowed the throughput to a
: crawl, and on the one 386/16 we have there, that machine does achingly
: slow TEXT MODE screen updates. It's like it is writing to the screen as
: if it is a vt100 terminal istead of something memory-mapped.

As compared to the same software running on, what? A 486/DX2-66? An
Atari 800XL? A 1040ST? Please keep examples to pre-1990, as that's the

era of 386-16's.

: After each batch is inputted, you have to total it up to print, on the
: 386/16 it just LABORS and LABORS at it. This is simple number-crunching
: that PCs are supposed to be famous for, right? If you threw a nicely
: written piece of 68K software in there with 68030/16s it would probably
: blow the roof off the place.

If you threw any comparable machine a COMPETENTLY and EFFICIENTLY written
piece of software it would probably fracture their minds.

: To make worse, the network (and you know how clone advocates love to
: wax on about how great their machines are in business networks) is ALWAYS
: flaking out or going down entirely. Sometimes you can't print through
: it, et cetera...

: THAT is my firsthand definition of the evils of Microsoft and Intel.

Well. You've certainly made a case against the shit software they run and
the competence of those who specify and maintain the PC's. What I am
missing entirely from this is how this is supposed to demonstrate the
evils of Microsoft and Intel (which I am generally the first to
espouse)... I can certainly find badly written bullshit for any platform,
any OS - and I can find DOA equipment as well. While you've certainly
disparaged the bank's I.S. department, I don't see anything relevant
enough to dump in MS or Intel's lap...

Yours in mutual Atari worship,

- Dan

121. HyperIt!

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-07 05:31:17 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950106213150.202032af@sonoma.edu>
Source record: 95662

I've been working on a new hyper-based program (like HyperCard for the Mac and CardStax for the Atari 8-bit) for the past day or so (dropped my other three projects because this is just too fun!) and keeping in contact with David Paterson (author of CardStax) and before I go to far, I'd like to know what the rest of you would like to see in it?

My first versions won't probably support all of the bells and whistles that CardStax does (POKEY Player music, printer dumping, machine language calls, mulit-mouse (my current pointer is controlled by a joystick)) but is being written entirely in Action! so it will be a bit faster and won't require a BASIC cartridge.

Currently planned is of course, card linking and buttons, but also possibly-scrollable text fields.. special effects when you change cards.. scripted language for making cards (so even without an editor, you can probably easily make a stack just by using TextPro or even just Copying E: to a file! :))

Also, since stacks are, in both HyperIt! (my program) and CardStax, just MyDOS subdirectories with the files used in them, I've made a program that sticks all of the files within a subdirectory together and saves them (as a ".DIR" file). (This needs some work before a final release though).

Anyways... again, anyone have any other neat ideas they'd like seen? The thing >I'M< really excited about is the ability to make simple interactive games, demos and BEST of all... TUTORIALS! Just imagine a set of HyperIt! or CardStax stacks all about how to program BASIC or Action! or use MyDOS!? Why, with PC Xformer out, I could convert my entire FAQ into a set of stacks and folks can use PCXf to READ the interactive FAQ! Wow!

ooohh.. that reminds me.. I will ALSO support variables in the scripting language! maybe even file i/o!?

>programmers like Jeff Minter are about.

Well, the word I've heard is that the original SR2K project was a
complete bastardization of SR, and that they've scrapped it in favor of
doing it properly. Also, in the recent settlement with Sega, Atari is
allowed to port 5 titles from the Sega library, and Sega will port 5
titles from the Atari library. The catch is, Atari can't touch Sonic, and
Sega can't touch *Star Raiders*. For Atari to exclude this from their
liscencing agreement makes me think that they intend to build it into a
system seller. Let's hope they do it right! :)

PS. I'm up for the petition idea! Maybe we can get Minter to do the port,
once he's done with Defender 2K.

In The Winter 03.01.95 Wrote Joe Walsh following stuff...

JW> Finally, in college, I continud to get straight A's in all the
JW> math courses, including Calculus and Statistics. I won't say I
JW> didn't have to work at those, but I *know* I would never have been
JW> able to do so well if it weren't for the Atari.
JW>
JW> Now that I have shared one of my stories, I would love to
JW> hear some of yours.

Well I baught my first computer 1986 after I reasived a little folder from our Union (I worked then as a mecanic and maked things to our military) whith different courses. One was a course called "Computer One" (Data 1). This course wasnt a course there you learned how to start MSDOS programs, editors or something like that. It was pure beginning in programming basic. The computers we used was VIC 20. After I learned PRINT and Input I was complitly sold and I didnt think about something else then to get myseldf my own machine. My cousins owned a 800XL and I visit them often to play Spelunkel and other games. After 3 weeks course I went downtown to bye my own Atari. They had an big machine there called 130XE (and there was also the first 520ST but they wanted $1000 for it) so I baught it and spend all wekend to write listnings from the manual.

One year later I baught a 1040 STF and it is that machine I write this letter whith and next to the ST is my old 130XE and running PRO BBS EXPRESS whith Sio2pc and BlackBox.

What is the meaning of life ifnt my Ataris was there evry day and waiting for me to get up from bed and let them work.

I'm also intresed of to get started whith C. I will take myself down to one of our usergroups here in gothenburg and sign up my intrest of C.
So thats next step for me I think.

I cannot say that I learned my matematic from programing Basic. I have learned Trigonometri from my mecanic machines at work.

From: winston@merk.com
Message-ID: <D21BCL.86E@merk.com>
Source record: 95672

As I recall, I had to give up on DETERM as it wouldn't give me a clean binary XMODEM download. It would give me a clean 7-BIT ASCII download, though. I'm not sure if later releases of this program corrected this problem or not....

126. Triad / Adventure Int'l

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-07 15:52:30 UTC
From: mcurrent@blue.weeg.uiowa.edu
Message-ID: <3emdbu$1h6h@blue.weeg.uiowa.edu>
Source record: 95666

Has anybody here ever played Triad, the game by Adventure International? I just bought a copy from American Techna-Vision (along with a bunch of other stuff). It says it was programmed by Ed Hobbs, and it has a date of 4/83. Finally, this appears to be a rerelease by StarSoft Development Laboratories of Winter Park, FL.

How do you play this thing?? I can watch it play itself all day, and it looks fairly cool, but despite all my attempts I can't get it to respond to any keypress, nor any action with the joystick.

Can anyone help?

Minter is known for his 2D games, not 3D ones.

I would rather be in favor of finding Doug again and if he is not
familiar with RISC programming, to at least keep him on as a watchdog.

I don't know why the hell it has to by MYDOS-only.

If it isn't going to be written in TurboBasic, it should be compatible
with Sparta as well.

Hey,
can anyone tell me how to run sio2PC under OS/2 Warp V3.0?
On my System (486DX/ISA/20MB Ram) regulary the connection is broken.
Any hints?

Thanks,
Andreas

: By the way... is 7800 Ballblazer the SAME as the released 8bit version?
: 7800 BB kicks butt!

The 7800 has a different graphics chip that is not totally analogous to ANTIC/GTIA. Although it does have DLI-like tricks, it uses a different form of sprite management, etc... The most profound difference is that the GFX clock is at 7.xx mhz and runs out of faster memory than the 6502. This fact alone is how the 7800 was able to throw up and manipulate objects at the same level of, maybe, a Sega Genesis.

It is possible that the 7800 version looks and acts exactly the same, but I bet it is even smoother with the player shape rotations and scaling.

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
```

65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and 40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's

(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act

as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in

MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk, you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).
To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!
After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar

with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also
have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating
System but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler which
runs in the background and accepts input from either a mouse,
a joystick or a touch-tablet and displays a mouse pointer on
the screen.
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'

modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will

be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the

character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b' with auxillary mode 'c'. Channel 'a' must be free or a 'Channel already open' (129) error occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk

OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program "Util" on the IBM which can read double-density Atari disks. Please see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with the ATR-8000(?)) The current version is '2' and it's available at
~~~~~~~

UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

I remember seeing something in a magazine, years ago, that was a mod. to allow XF551 drives to format the second side of a disk when you turned it over - i.e. so I can write 2 single sided disks, so to speak - instead of one full d/sided disk.

Does anyone know what I have to do to be able to format this way? I figure it has something to do with that little hole being on the wrong side and so won't format - is there an LED with matching light dep. transistor or something that I can remove or something? Or is this used for timing?

It would be great to be able to format disks like a 1050, without having to get a friend to format them for me on his 1050.

Any help would be much appreciated,
Richard =8-]

PS. All these ppl saying about how Ataris having helped them...
I think that my 8bit extends my imagination - and I have enjoyed growing up with one - and am still growing up with it! *grin*

It doesn't HAVE to be MyDOS only.. but for now, for ease of my programming, it's being set up for MyDOS (although it does use ">" for dir. pathes I think.. if not, it's a quick change) and it's being tested in MyDOS (I don't use Sparta and thus don't have a copy of it).

If anything, if it refuses to run in SpartaDOS, I can compile it under Sparta and release a SD version (or, if that version works ok under MyDOS, just release that version only).

Actually, if it weren't for me liking MyDOS so much, I might've made it Sparta-only (and pissed off the OTHER percentage of 8-bit Atari users :)) because of the way NOTE/POINT works in Sparta.

Anyway.. on another note.. anyone want to test HyperIt! as it's being made??

(Testing bugs is useless (I hope :)) because I kill all bugs I know about. Testing foolproofness is useless because I KNOW it dies on errors (right now). COMMENTs and SUGGESTIONs on the other hand is what keeps New Breed Software (me) WORKING on programs! <HINT HINT HINT>!)

>
>Well, I admit, I have not been studying the differences. All I know is
>that WinNT can be used on a wider array of CPUs.

That's just because it was written specifically to be portable to many
high-end RISC machines. Win95 was optimized for the 386/486/Pentium, which
most people use today. Making NT portable increases its memory demands, since
it must all be written in a high-level language, with minimal if any
machine code optimization.

> It isn't tied to the Intel CPUs and this is good.

True. That doesn't make any OS tied to Intel Bad, however.

>Win95 looks just as tied to the x86 series as any other Microsoft OS to
>me, and that, to me, does NOT spell progress because the stifling of the
>computer industry is just as much a factor of the long-in-the-tooth
>survival of a CPU series that was never the best even 10 years ago.

Microsoft wants to sell software to today's computer owners. Most of
today's personal computer owners use a 386, 486, or Pentium machine.
Most of them have 4 MB or less of memory. Making a portable OS requires
more memory than a nonportable one.
Look at it this way: So many people have purchased 386 or higher Intel
32-bit machines in the past few years, just to run a 16-bit operating
system, DOS/Windows. When Win95 finally ships, all those people will be
able to use their computer to its full 32-bit capabilities. I see that
as major, overdue progress. (Yes, I know they could use OS/2, but most
of them don't know that.)

[...]
> but just about every RISC operating
>system is overly bloated.

Two reasons I can think of for that are 32-bit (rather than 8- or 16-bit)
code, and allowance for portability.

> I know of none that really offer a choice in
>how far you go in your implementation.

Many (most?) versions of Unix do.

>Theoretically, you could probably design a RISC OS that is really nice and
>in its base implementation, resides in ROM.

NO! Putting the OS in ROM is a Bad Thing. That means the user cannot easily switch to a different operating system, and even upgrading to newer versions of the same OS is difficult. With a disk/RAM-based OS, upgrades or replacements can easily be downloaded and installed without opening the machine.

>For CISC machines, Amiga OS takes up 512K ROM and probably just a few

The Amiga is only a 16-bit machine, isn't it? One of the best 16-bit machines, but still only 16 bits. That makes all the code smaller than 32-bit code for more modern machines.

> When you move to RISC there is some code
>bloat anyway, but still, 2 megabytes at the utmost for a nice solid OS is
>all you really need.

What you "need" in an OS depends on a lot of things, including how many people you want to sell it to, how easy it is to use, and how flexible you want it to be. (Those factors are closely related.)
Using the 512K Amiga OS as a base, I would put the size of a nearly identical RISC OS at closer to 4 MB: first double the size when you go from 16 to 32 bit code, then multiply by 4 when you go from CISC to RISC. And I'd probably want more in an OS for a RISC machine than just an Amiga OS.

>where did the users get the idea that MS-DOS/Windows was all they needed?

It ran all their old software.

>Where did they get the idea that preemptive multitasking was 'new' when
>OS/2 came out?

It was new for Intel machines.

> Where did they get the idea that segmented memory and
>mega-kluge banking was in any way acceptable or state-of-the-art?

Nobody thinks it's state-of-the-art. When the 8086 first arrived, that mess was acceptable because it allowed a lot more memory than other chips of the time (remember the 8086 came before the 68k). Now it's considered barely acceptable just because so many machines out there have Intel chips, and software/OS people have figured out ways around it to make it transparent to the user.

> They
>are almost totally ignorant of computers to the point where they have been
>hand-fed the BS that people like MS and Intel spew out, and they have been
>doing this for so long that they are almost hopelessly brain-dead.

Nah, most of them started out hopelessly brain-dead. Then they accepted what they were told. Now if you want to work with them, you must use the same machines and OS's.

I don't like DOS or Windows or the Mac OS, but if I want to deal with the rest of the world I must at least be able to use them. Of the three, I like Windows best; Win95 looks like it'll solve many of my complaints about Windows. When I buy a new computer, it'll be an Intel-compatible machine, simply because that is the most flexible platform. Then I'll put Linux (or another Unix) and Win95 on it... and hope that I rarely have to boot up with Win95.

>It's not just the average joe, it's the press too. I saw a CNN article
>on the Pentium bug that referred to the Pentium as the 'Fastest chip in
>the world'.

The mainstream press knows nothing about computers. They never will. They use Macs, if they touch computers at all. They know LESS about computers than the average joe. That's why I'm always simultaneously entertained and frustrated when I read a newspaper article about computers or the 'net.

Those two factors are probably the biggest problems: old, therefore the
writers didn't know about modern techniques and ease-of-use; MS-DOS, therefore
no multitasking, and no 32-bit speed.

>The software is so bad that you have a dearth of editing or undo
>flexibility. On all the fields, you can enter data, you can destructively
>delete, but you can't use the arrow keys to go back and insert text. This
>is basic shit folks!

That seems to be a common problem in old software, especially in MS-DOS.

> Most Atari8 applications allow that kind of stuff!

Yep, they were designed for the average home user.
It seems odd to me that "home" software is usually easier to use than
"business" software, yet usually the home user knows what's going on better
than the business user, since the business user was just plunked in front of
the machine, while the home user actually wanted the stuff he uses.

>There are also a lot of places where you 'pass the point of no return'.
>There is almost no ability to edit out mistakes short of deleting
>records or a whole session's worth of work. This slows down productivity

I know exactly what you mean.
I think the programmers at my company went to the same school as whoever wrote
your bank's software.

>What about multitasking? MULTITASKING?? These machines have no idea
>what that is. One of the stations is tied up for a good hour a day or
>more printing out reports. If it could only MULTITASK, you could switch
>a window, and the terminal would be freed up for more inputting.

Since it's DOS, MT is difficult if not impossible. They could have it print
to a network print queue (as we do), which would let you regain use of the

computer sooner.
One problem with multitasking (and multiuser) in database-type applications
is that there are often problems with more than one process wanting to read/write
the same record or file. So somebody has to wait anyway, and MT loses some of
its advantage. We often have to make everybody stop what they're doing so that
one person can update all the files. It could be done better, but when it's done
badly like we have it, it's a real pain.

>Of course, that may be moot if it would have slowed the throughput to a
>crawl, and on the one 386/16 we have there, that machine does achingly
>slow TEXT MODE screen updates. It's like it is writing to the screen as
>if it is a vt100 terminal istead of something memory-mapped.

Our 386's are fast enough, but that 286.....
I wouldn't be surprised if your program does write to the screen serially somehow,
just because so many data processing programs are written with terminal connections
to mainframes in mind, rather than freestanding PCs.
My company is now in the process of switching from a networked PC-based system to a
system based on somebody else's mainframe 100 miles away, connected via normal phone
line to a 9600bps modem, then to a multiplexer which distributes everything to
terminals in our office. I thought nothing could be worse than our old setup, now
I'm starting to think I was wrong......

>After each batch is inputted, you have to total it up to print, on the
>386/16 it just LABORS and LABORS at it. This is simple number-crunching
>that PCs are supposed to be famous for, right? If you threw a nicely
>written piece of 68K software in there with 68030/16s it would probably
>blow the roof off the place.

Number-crunching, disk-crunching, record-crunching, etc. Computers are famous for it
because even our Ataris can do it faster than we can by hand. The speed probably isn't
a problem with the architecture of the computer, since you're probably dealing with
records less than 64K. Just throwing in a _nicely-wrtitten_ piece of DOS software
would probably be a vast improvement, and switching to a better OS would make
it even better.
That sort of application does have a lot of complications that make it slow, which
is why I'm not pursuing a job writing that kind of software.

>To make worse, the network (and you know how clone advocates love to
>wax on about how great their machines are in business networks) is ALWAYS
>flaking out or going down entirely. Sometimes you can't print through
>it, et cetera...

One of my major functions at work is maintaining the network. Networks are
extremely helpful when they work, but when you start to depend on them
it'll cripple you when they go down. And they WILL go down. The trick is
to keep downtime short and rare, and to keep reliance on the network to a
minimum. It helps a LOT if you have good wiring.

>THAT is my firsthand definition of the evils of Microsoft and Intel.

Your problems go far beyond MS & Intel. I'd start with whoever wrote
your software, maybe the network admin, and whoever decided that the system

should be DOS-based.
MS-DOS simply wasn't designed for that sort of thing. (I sometimes wonder
what it WAS designed for, though!) I would have gone with Unix, but
that's just a personal bias. I wouldn't blame Intel, though.

On the XF551, that hole is used ONLY during formatting. Removing the sensor
would make things worse. I think CSS sells a mod to fix the problem. I don't
know if there's anything you can do to it yourself.

142. What's wrong with big auction lists?!

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-08 03:15:45 UTC
From: "LARSEN, JEREMY NEIL" <JEREMY@MUSIC.CC.UGA.EDU>
Message-ID: <07JAN95.24043639.0165@UGA.CC.UGA.EDU>
Source record: 95683

I am currently compiling an auction list for this and some other newsgroups (tandy, 2600vcs, etc)... I was wondering, why would anybody dislike big auction lists? I don't understand what difference it makes if someone posts a "32k update every 24 hours"... why does the size matter?
Being of Atari mind, I don't understand and am not too familiar with "new" technology, i.e. newsgroups, Internet, etc... I just dial up the mainframe at my school, UGA, and use its readNews function. It says how many lines at the top of each post, and if it's 2500 lines of stuff I know I don't care about, it's off to the next post (if the Subject interests me...)

I am just worried that it would offend too many people if I post my auction list. I did not use the RETURN key sparingly when listing the features of each of my auction items. Is hatred of auction lists a common thing? What's the consensus?
I always read the posts that are sales and auctions! :)

143. Re: What's wrong with big auction lists?!

Source record: 95684

Well, not everyone is like you and I and have "nearly infinite and instant net access."

Some people pipe in newsgroups onto their BBS, which means they have to download EVERYTHING, at whatever speed their modem is (hopefully FASTER than 2400, but not always!!) and stick it on their hard drives or disk drives.

Some people read news offline, which means all of the same thing (except they can personally decide to add message threads or authors into their kill-file.. at least, you'd think so. With a BBS on the other hand, unless they feel like censoring it, which means reading all of it all of the time whether they care about that group or not, they would be getting ALL of the messages (which in this case would be 32K of aution posts plus whatever the normal messages weigh, EVERY 24 hours!) ALL of the time!)

Finally.. what if someone doesn't read a newsgroup EVERY day (24 hours!)!? They may see 5, 10, 15, whatever! copies of the same message, 4 (or 9 or 14 or whatever) which would be completely irrelavent to them by then ANYWAY!

And lastly.. like it's been said before, if you're going to post to comp.sys.atari.8bit, try to post Atari 8bit MESSAGES! If you're going to post to comp.sys.cbm, they'd probably not like to see the Atari 8bit stuff, too (just like we'd probably not like to see the Commodore 64 stuff!).

There ARE message newsgroups available FOR buying/selling stuff. Most people get them. If not, they can always request you to e-mail them a copy of it (wouldn't it be worth it to you? I mean, if you're going to post it every 24 hours, e-mailing it once would be little bother!)
So INSTEAD of posting to all of the computer-based newsgroups, post to one computer-for-sale-based newsgroup..

OR, like I said up there about Atari 8bit and Commore 64, you can split the auction file up into Atari 8bit Auction and Commodore 64 Auction, rather than "EVERYTHING Auction!" I wouldn't want to have to sit down and read through 32K of stuff just to find the Atari section (even if I was looking to spend lots of money right now).

Soooooo.. I hope my summary of what everyone else has said lately helps you understand how use c.s.a.8-readers feel!

Advertising isn't bad.. LOTS of advertising is bad.

: 32-bit code for more modern machines.

I don't see how bitness = code size. I think it has far more to do with
programming style and other archetectural particulars (like throwing in
shitloads of drivers whether you need them or not). I don't see how this
means you need an OS that is _32_ times larger than the Amiga one (NT).
If it were a linear thing, then a '32-bit Amiga OS' would be 1 meg and not
512K. And I think your info on the Amiga is unfounded, at least for the
AGA ones like mine, but I am not qualified to debate it.

: >Where did they get the idea that preemptive multitasking was 'new' when
: >OS/2 came out?

: It was new for Intel machines.

That doesn't say much for Intel machines.

: Nobody thinks it's state-of-the-art. When the 8086 first arrived, that mess
: was acceptable because it allowed a lot more memory than other chips of the
: time (remember the 8086 came before the 68k). Now it's considered barely
: acceptable just because so many machines out there have Intel chips, and
: software/OS people have figured out ways around it to make it transparent to
: the user.

So you happen to feel that holding onto what is long-in-the-tooth
archetecture is better than cleaning the slate?

We'll never move forward if we remain afraid to ditch the Intel series.
This doesn't mean losing compatibility because RISC will run 'legacy' apps.

Just because everyone is using something doesn't mean we should never
move forward. Just because performance is okay now with Pentiums and a
good OS like OS/2 doesn't mean that is acceptable for the longterm.
Clone owners already have good choices for operating systems and if they
themselves become orphans in the next couple years, they have no reason
to fear the march of progress.

IBM would not be going RISC unless they saw the end of the line of the
Intel x86 series.

I just think the 'aint-broke-don't-fix-it' attitude doesn't work in the
computer industry, and after this huge period in computer stagnancy, most

people won't look back at MS-DOS/Windows with fond memories, nor will they regret not being able to run whatever minority of code won't run in emulation because far greater glories await and they will forget the past--at least far more likely than they will forget the charm of the 8-bit machines. Even the games which everyone loves on clones will likely be done again far better on the next generation of machines, something which has not been the rule with 8-bit games.

>frustrated when I read a newspaper article about computers or the 'net.
>
The mainstream press knows nothing about anything. There are few journalists around anymore; we've mostly got reporters who read press releases and record press conferences. No one digs into background or checks facts. I've even heard of stories being filed based on preview copies of speeches that the writer received ahead of time; a speaker pressed for time once said none of the quotes attributed him the next day in the paper.

The state of the press in North America is nothing short of abysmal.

One more thing about long lists: more and more people are paying for net access.
If you use offline readers, you grab everything. Say 10 articles at 32k
each is a fair bit on online time, especially at 2400.
KISS, I always say. Professional marketers know that targetting specific
groups brings a much better return than scattershot. Providing contact
info for other things available is fine. Or collecting names of respondents
for future mailings. But Canter and Siegel were shown what several million
irate people can do. No need to antagonize a smaller group.

To add to the mystery, ATV threw in two copies of Triad in my order, and
they both behave exactly the same.

Similarly, I now have two copies of Mission Asteroid. The first is the
original release by Sierra On-Line, and works fine. The second is a
re-release by Green Valley, and locks up early in the game every time.

I wonder how many re-releases of games there are out there that don't even
work.

In their ad in the Jan/Feb 95 Current Notes, American Techna-Vision lists the Ballblazer cart for $4.95.

In their new catalog, B&C ComputerVisions lists both Ballblazer and Rescue on Fractalus on carts for $9.95, or the loose Ballblazer cart for $5.00.

In their ad in the Sept./Oct. 94 Atari Classics, Toad lists the Ballblazer and Rescue carts for $7 each, Ballblazer disk for $7, and Rescue on disk for $14.

>I can remove or something? Or is this used for timing?

While CSS does sell a drive upgrade that will allow you to use
your XF551 just like a 1050 as far as formatting the second side of a
disk, I have a cheaper (but more difficult?) solution that works for me
Since all that is needed is a couple of holes on the other side
of the disk, I ripped apart a disk,turned the outside envelope sides
over to create templates so that a hole punch can be used to make perfect
holes in both sides of the disk envelope of any other disk.
Perhaps that isn't clearly written. What needs to be done is to
create holes just like the original ones, but on the opposite side of
the center ring/hub. The hole must be through the jacket only, not the
disk itself. They must be placed well, too, so that the sensor can
actually catch the light as it passes through the hole. So, I took
apart a disk to use as a template. Then, I flipped them over so that
the hole on the template lined up with where the new hole should be on
the disk. Then, I inserted a hole-punch between the disk and the
outer jacket/template, then punched it. Repeat for the other side.
This works very well. Be careful not to scratch the disk itself
while doing this, of course. But, I have never had a problem with this...
that is I have never ruined a disk, and it has always formatted flawlessly
in my XF551.
I do this because it is rare that I need to format the second side
of a disk...because I usually use the 360K DS/DD format. Thus, it does
not make sense for me to pay $34.95 for the upgrade, then take my
drive apart and install it.
BTW, I read of this fix in a circa 1980 computer repair book
I was reading while in college (man, I miss that library).

Well, now we are getting WAAAY off topic. :) But, I agree.
When I read an article (whether in a newspaper or a "mainstream" or
"general interest" magazine like Time or Newsweek) that has a topic
I am knowledgeable on, as a rule I spot gross inaccuracies, misleading
statements, and outright falsehoods. Since I began noticing this, I
have stopped believing what is published in these mediums on topics I
am unknowledgeable about.
As has been noted, the writers of computer-related articles
seem to be the worst offenders. Maybe it is just the perception,
since that is something we all know a *lot* about. But, I tend to
agree with the person who said that most "journalists" don't use
computers (other than when required at work, meaning for word
processing) and have no desire to do so, and therefore are completely
unqualified to write about the subject.
I suppose I should note that there ARE a few journalists out
there who know their topic, but these seem to be concentrated in
political reporting.

Although there are now more articles published in the mainstream
press that are about computers than there were in, say, 1982, it is no
less true now than then that if you want the real information, you have
to seek out "computer mags" (ie, Mac World, PC Week, PC Magazine, etc.).
And I am not too sure about that genre anymore either, with the
arrival of magazines like "Wired" that are geared to the average user
rather than the technophile.

I'll just add my two cents here to the great replies already
posted.
All I want to add is that, here at the USENet, advertisers
have an opportunity to target their audience with precision, rather
than the common, bulk-mail/prime-time advertisement method used in
the "real world", yet few take advantage of it! If you are selling
Atari stuff, by all means tell us about it. But, if you are selling
commodore stuff, tell comp.sys.cbm about it. If anyone here is
interested in that stuff, they are reading that newsgroup as well and
will therefore get that segment of your auction as well.
The USENet archetecture has allowed people to segement
themselves into the tiniest,most obscure groups imagineable. Take
advantage of it: target your potential customers. Let them feel like
you are selling directly to THEM, rather than to the whole darned
USENet population.

Just a thought here, but perhaps the companies that produced
these re-releases used inferior disks that have since succumbed to the
effects of time, while the originals which were released on top-quality
disks have survived better?

Actually, Unix varients were available for IBM PC type boxes
almost from the begining of the PC. OS-2's claim to fame may
somewhat validly have been the first preemtive multitasking to run
standard DOS programs relatively well in a multitasking
environment.

>too (just like we'd probably not like to see the Commodore 64 stuff!).

My biggest beef with these HUGE AUCTION messages is that the folks who post them never get involved in ANY discussions - but access csa8 ONLY to post huge auction messages. The person everybodies referring to currently is a prime example. Has he interacted in any other threads or discussions? NO! Has he aided or helped anybody in csa8? NO! Yet, he'll gladly use csa8 to commercially market his 8bit wares and blast all of us who are DOWNLOADING these articles. I'm curretnly using a windows based PPP winsock package to grab all my news articles, and everything I read ends up on my hard disk..
>
>Advertising isn't bad.. LOTS of advertising is bad.

Exactly how I feel. CSA8 needs SOME advertising, but 34k every 24 hours from the same person is an extreme

I was doing that, but I eventually found it easier to just put PKUNZIP
in the DOS directory so it was always in my path. Then you can execute
it without moving it around every time you use it. Just put your .ZIP
file in a directory and type the zip command.

Okay..I just spent 18+ hours converting parts and ram from a flakey 256k
board to a 1meg board... swapped the os chips and it worked at 256k.
(The 1meg had all the ram blown.) Now.... Question...

Where is the jumper from ram chip1/bank1 supposed to go... and from
what pin on the ram chip? I assumed pin 3 I think.

also... WHERE CAN I PURCHASE THIS FUNKY ZIP RAM WITH THE REVERSED LINES?!?!

I would like to take it to 1meg.

Also.. anybody every modify the os so it can format SINGLE DENSITY?!?!
I am tired of having the sector sizes be fixed and needing a meg MIO
to put 4 90k disks on ...

This looks like a rogue thread, however, there is no reason for shell users (if you guys are shell users) to have to use your own machine to zip and unzip. Even if all you have is an Atari8, you can zip and unzip off the shell.

```

It the days of Xenix, this was a good point. Now with the popularity of Linux, that problem is being solved. Spreadsheets, databases, and many other applications are now freely available, and commercial vendors such as WordPerfect are now selling versions of their software for Intel-based Unix platforms. And Emacs is much more powerful (and arguably easier to use) than even the best of the old Atari word processors, which many people here still use all the time. Combined with a post-processor such as LaTeX, Emacs is more powerful (but NOT as easy to use) than just about any current commercial word processor. (vi is OK for simple things, but I like emacs.)

>Unix and other OSs for the Intel machines may as well not have existed
>all those years because not much good mainstream stuff was available for it.

That's true as far as the mainstream goes, but Unix has not historically been an OS for the mainstream, maybe just because it wasn't sold that way. I personally hope that changes, so mainstream software for a powerful OS becomes more prevalent.

>I don't see how bitness = code size.

OK, maybe 32-bit code isn't quite twice as big as 16-bit code, but it is
bigger, simply because it works with 4-byte integers rather than 2-byte.
BTW, another thing I said may be inaccurate. I said RISC code is 4 times
the size of CISC code; this is true if you count instructions, but because
the bytes per instruction may vary, I don't know how true it is if you count
bytes.

> I think it has far more to do with
>programming style and other archetectural particulars (like throwing in

If you want it to work on many different machines (even of the same
processor type) and therefore sell it to many people with different hardware
configurations. you do need shitloads of drivers.

> I don't see how this
>means you need an OS that is _32_ times larger than the Amiga one (NT).

NT is made for a totally different, much more demanding, application than
the Amiga OS. If you want an Amiga-Microsoft comparison, look at Win 3.1
instead of NT.

>: >Where did they get the idea that preemptive multitasking was 'new' when

>: It was new for Intel machines.
>
>That doesn't say much for Intel machines.

On the contrary, since OS's such as OS/2, WinNT, Win95, and Unix do run on Intel
machines, it says nothing against Intel machines. If the software developers
took a long time to develop OS's that took advantage of the 286 or 386's
capabilities, it's not Intel's fault.

>: Nobody thinks it's state-of-the-art. When the 8086 first arrived, that mess

>So you happen to feel that holding onto what is long-in-the-tooth
>archetecture is better than cleaning the slate?

When I have a large investment in the old thing, and the old thing still can do
the job, yes.
Are you suggesting that we should all get rid of our long-in-the-tooth Ataris?

>We'll never move forward if we remain afraid to ditch the Intel series.

We seem to have moved forward quite a bit since they first took hold of the
market.
Now it's the old software we need to ditch. The hardware has a lot more
capabilities than most current software takes advantage of. Did you know
that the stupid memory addressing problems of Intel chips disappear when
you use their 32-bit "protected mode"?

The current trend seems to be to make (basically) the same software run on
multiple architectures, so it's no longer quite as important what hardware
you have.

>This doesn't mean losing compatibility because RISC will run 'legacy' apps.

You seem to have a lot of faith in emulators. Have you seen an emulator that
will run 386/486 software at 486-33 speeds on any RISC machine? Emulators are
slow. To run at the same speed as the original machine, they require a machine
about 10 times faster.

>Just because everyone is using something doesn't mean we should never
>move forward. Just because performance is okay now with Pentiums and a
>good OS like OS/2 doesn't mean that is acceptable for the longterm.

In computers, nothing is acceptable for the long term. The technology
(both hardware and software) changes too quickly. People have to balance
what is best for what they already have (they can't start over with every
improvement in technology) with what is currently required (and available)
and what will be required and available in the foreseeable future.

>Clone owners already have good choices for operating systems and if they
>themselves become orphans in the next couple years, they have no reason
>to fear the march of progress.

There are so many that they simply won't become "orphans" in the next couple
of years -- they are a powerful enough force that they won't allow it too
happen. Instead, you'll see a gradual evolution to better technologies,
just as we've seen in the past decade.

>IBM would not be going RISC unless they saw the end of the line of the
>Intel x86 series.

Intel wouldn't be going toward RISC with the Pentium (yes, the Pentium
is a step toward RISC) unless they saw the end of the line of CISC.
IBM saw the shift coming and saw an opportunity to take over Intel's
dominance. The difference is that Intel doesn't want to leave current
users out in the cold, so they're taking a more gradual approach.
IBM is taking the Jack Tramiel approach -- start over, and hope everybody
follows along. Time will tell who wins, but we've all seen what happens
when the old is completely discarded in favor of the new. I don't think
it would've happened to us if Atari 8-bits had been as dominent as
x86 machines are now.

>I just think the 'aint-broke-don't-fix-it' attitude doesn't work in the
>computer industry, and after this huge period in computer stagnancy, most

If you think the last 10 years have been stagnant, you haven't been paying
attention. And nobody inside the industry has the "ain't broke..." attitude;
they're fighting to get the users to lose that attitude so they can sell
them the Latest and Greatest. There's a difference between "fixing" and
"trashing", though.

>people won't look back at MS-DOS/Windows with fond memories, nor will

I don't look at it NOW with fond memories.

>they regret not being able to run whatever minority of code won't run in
>emulation because far greater glories await and they will forget the
>past--at least far more likely than they will forget the charm of the
>8-bit machines.

Tell that to your bank's data processing dept. Business computers never die,
they just get sent to a different department. :-)

> Even the games which everyone loves on clones will
>likely be done again far better on the next generation of machines,
>something which has not been the rule with 8-bit games.

You're right, nobody will keep an Intel machine around just for the games --
they've been done better elsewhere.
Whatever is the current popular platform will always have games written for
it. And if it doesn't have special capabilities to handle games (as our
old Ataris do), the game can easily be rewritten for whatever comes next.

It's the business and specialty applications, along with the monetary
investment in hardware and software, that keeps people hanging on to
DOS and Intel. I agree that DOS needs to go, but I don't see any compelling
reason for getting rid of the Intel platform in general yet.

>says how many lines at the top of each post, and if it's 2500 lines
>of stuff I know I don't care about, it's off to the next post (if the
>Subject interests me...)

That sort of net access is very convenient, very powerful, and very
misleading.
The mainframe at your school had to get each message from another
machine, over whatever communication lines it uses for net access.
Then it had to store each message on its own disk.
Only then is it able to list for you the subjects and lengths of
the messages it has, so you can easily decide, before downloading
the message, whether you want to read it. You can even stop
receiving the message if, while reading it, you decide you don't
want to read anymore.

Not everyone can do that.

Imagine that YOUR computer is the one receiving ALL messages
from the net, through a 2400, 9600, or maybe even 14400 bps
modem. YOUR computer stores them all on its hard drive, and
only then can you decide whether or not you want to read
specific messages. If you spent an hour downloading messages
for a single newsgroup, only to find that it was all
"MASSIVE AUCTION" messages that you didn't care about, you
would not be a happy camper.

>I always read the posts that are sales and auctions! :)

I never do. :-(
Luckily I'm able to decide before downloading the message. :-)

180. SIO PORT BUSTED! DAMNIT!

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-09 04:24:37 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9501090425.AA14124@zippy.sonoma.EDU>
Source record: 95620

There was a lose pin in my SIO port lately and it finally came out with my SIO cable when I pulled it out! It's one of the two farthest ones on the top row. Either the #2 pin or the #12 pin. I can still do stuff, at least with disk drives (well, SIO2PC.. my floppy is acting up and I need a new SIO cable for it anyway.. that's coming in the mail though).

anyway, is this something to worry about? I have jotted down pinouts for an SIO cable and wherever I got my copy they happened to leave pin 12 unmarked. Pin 2 is supposedly clock-out.

Here's what my port looks like (looking at the back of my 1200xl):

```
+ + + + + o
+ + + + + + + Where "+" are the pins, and "o" is the missing pin.
```

HELP!

Thanx a lot...

I think a good way to go about doing a huge net auction, provided it's video game oriented (you didn't say enough in your post for me to be sure) is the following:

First, post the entire listing to rec.games.video.marketplace once (maybe again a week or so later if it's a long one [note--I did a small-medium sized auction a couple of months ago, and kept getting responses to my later postings of the updates...]).

At the same time, post just the appropriate section(s) of your listing to the appropiate newsgroups (comp.sys.atari.8bit, alt.atari.2600, etc.), and say "hey, I'm doing an auction. Look in r.g.v.marketplace for the full balogna. It's called '_____'."

And, then, just send e-mail updates--set up a mailing list of everyone who replies to your post, and send off any updates to that list.

(at least, that's how I plan on conducting my semi-big auction in a week or so--shameless plugs, gotta love 'em).

If there was no such thing as C code, programmers would revolt if they had to actually sit down and write Intel assembly. That might not mean much to some, but if you want to judge a processor in a scientific fashion, you have to take into account its memory management, its registers, etc... and no programmer will tell you that Intel machines are a joy to program for.

And an aversion to assembly hasn't done much to foster streamlined and optimized assembly, which is okay as long as Intel keeps on making faster clock speed chips, but this kind of crud represents everything I hate about computers.

I really respect the Lucasfilm programmers who actually went ahead and took that journey into hell which is Intel assembly to make games like X-wing.

Daniel Woodard (SA073@getty.onu.edu) wrote:
: I was wondering if many games came out for the 7800? Why did nintendo do
: so much better than the atari?

Atari went down the crapper in 1984, and when Tramiel took over, he really spent the better part of 2 years dragging his heels before he released the 7800 after Nintendo reclaimed the videogame market with the NES 8-bit. That explains it. I'm not sure Tramiel had the resources to market the 7800 in 1984, but he should have at least kept it out there, since it was done, manufactured, and boxed in 1984 by Warner-Atari.

The 7800 is most similar to the TurboGfx 16 in my opinion in that the GFX chip has more impressive technical specs than the CPU. The 7800 GFX chip runs several times faster than the CPU. The Maria chip was partly based on Williams sprite technology ideas, and partly on Antic/GTIA (though Miner was not involved with this one). That's why Robotron is so good on the 7800.

The 7800 was definitely the most advanced machine when it was completed in 1984, but by the time it hit the scene, it was just an also-ran.

Hi. About a year ago, I posted a similar question but had no luck in
solving it (thanks to anyone who trued to help). My problem is this :
I have the CRIBBAGE and DOMINOES cassette games and would like to
transfer them to disk. I am using TRANSDISK but these games will not
load properly from disk. Does anyone know how to transfer these games /
have the source code for them or other similar games ?

Thanks in advance.

Message-ID: <3er6bj$jt2@majestix.uni-muenster.de>
Source record: 95632

Hi, folks!

A friend of mine has an old Atari PC/2 at home, in which he'd like to
install a HD. But therefore he needs to enter the BIOS, and yet he has not
succeeded.

The BIOS was manufactured by Award Software Inc., (c) 1987 NSI Logic.
On the BIOS chip is written CLOL 701-001, Atari PC 3.07

Does anybody know how to get into the BIOS area?

Please reply to: paczkow@private.ruhr.de
or: paczkow@uni-muenster.de

TIA!

Lines: 81
Message-ID: <3er6bl$rqb@nic-nac.CSU.net>
NNTP-Posting-Host: zippy.sonoma.edu

I must be really excited about this project to be posting a message about
it here at 3am in the morning!

Anyway, for those who haven't seen my babble about this before, this is
a HyperCard (a Macintosh program) clone for Atari 8-bits. Those of you
familiar with HyperCard, MacroMind Director or other Mac (and maybe
MS Windows) programs, or with CardStax for the Atari 8-bit will know
what the program does in general.

To summarize it best I can, it's a program which presents the user with
"Cards." Cards are screensful of information; in text and in graphics
(which in itself can of course contain more text). They also contain
intelligent "buttons." These buttons can look like whatever you want
(either by having them drawn into the graphical background, or adding
them from smaller graphics files (I'll hopefully have Print Shop Icons
and Daisy Dot III fonts supported at some point)).

When you "click" a button (move the arrow pointer over one and press the
[Fire] button (it currently only supports joystick), something happens.
The most basic occurance is the card will change. Buttons will be
different, the pictures will be different, and the text will be different.
(Well, strike those "will"s and turn them into "may"s.)

What's the purpose? Well, the two biggest uses I see myself putting HyperIt!
to are tutorials and games. The tutorials will be graphical and interactive,
both very 'hip' these days, and the games will be more role-playing,
educational or adventure, since it's not exactly an arcade-game designer's
environment! Those of you who have seen games like Myst, Seventh Guest,
and the more graphical Zork-ish games can imagine what the games in HyperIt!
would be like.

For those interested in history and technical information, it's being
written totally in Action! (the very famous C/Pascal/BASIC hybrid language
for Atari's released by ICD back in 1983) so it's pretty fast and flexible.
Although the 48K is being eaten very quickly, it still supports high
```

resolution graphics; including a 1K screen font, the 8K of graphics, and even an 8K snapshot (to reduce disk access when going from one card to the next; you can make a graphical background and no matter how many cards you have which use it, they'll never need to load it again!).

The reason I'm writing the program is because I made a rather large HyperCard Birthday Card for my girlfriend a few months ago, so I became familiar with (and even <gasp> fond of) the HyperCard environment.
I decided I'd like that type of program for the Atari 8-bit. There's a lot of potential.

The second reason I'm writing it is as practice for when real code will start being made for the ADOS project (talk to me later about that if you care; it's going to be (if it happens!) a GUI environment for the 8bit Atari).

The third reason is because I saw David Paterson's "CardStax" program (after I FINALLY got a copy of it! I was quite impatient about getting a working copy as I really wanted to see it!) and found that since it was in BASIC, it was a bit too slow to react, and that the editor was far too confusing to deal with (well, of course I never read the instructions, but with HyperIt!, you work in a scripted language which is fairly flexible. The syntax looks horrid (parameters for a command are place on the lines following the command; separated by End-Of-Lines rather than Spaces or Commas!) but a quick editor could be created to give the user a better editing interface than a text editor, trial and error and patience! :)

(Well, I didn't expect a screenful of "reasons I wrote this," but there it is! :))

Anyway, if anyone would like to Beta-test it, I've been testing it without the Action! cartridge, collecting all of the files and ARCing it up every day or so (mainly so my current non-volunteered beta tester, David Paterson <grin> can take a look at it and tell me what he thinks).

The current ARC including source code and a sample stack is approx. 47k and the program currently requires MyDOS 4.5x (I use 4.53, so if you use something else, I can't promise it will work properly!)

Thanx for listening!

>On my System (486DX/ISA/20MB Ram) regulary the connection is broken.
>Any hints?

Well, my only experience lies within OS/2 2.1, but it should be of some use,
I have a 386 33MHz myself and it is too slow for sio2pc to run under OS/2, but
since your computer is about 4 times faster than mine it should b possible,
try enable COM-direct access in the MS-Dos settings menu, hovever I have a
program called frontdoor that accesses the com-port at 38400 at no problem,
It utilises something called a Fossil- driver to talk with the com-port, and
this works even without Direct- Com acces enabled.
Conclusion, it should be possible after some fiddeling with different settings
but you could alway run it from MS-DOS, you do have boot-manager do you??

>
>Thanks,
> Andreas

Ohh, I noticed fido address, then you should be familiar with Fossil drivers
my Fido address is 2:220/230.1 (I believe)

Source record: 95640

: We'll never move forward if we remain afraid to ditch the Intel series.
: This doesn't mean losing compatibility because RISC will run 'legacy' apps.

We will go forward and have 100 percent hardware binary compatable with the Intel chips but offer true 64 bit technology using not RISC or CISC, but VLISW chips (Very Long Instruction Set). This combines both RISC and CISC together to have the best of both worlds. This along with 32 different registers using register renaming and then combine this with Windows 95 and Bob. Plus companies are starting to put Multi-Purpose DSP's on PC motherboards. What else do you need?

The PC has changed since 1981, it has to change to survive (I dont know if you know this, but the PC has had to change to survive and will continue to do so.)

I find people so amusing when they say the PC is dead, it shows their mentality (brainless motorola drones)

: Just because everyone is using something doesn't mean we should never
: move forward. Just because performance is okay now with Pentiums and a
: good OS like OS/2 doesn't mean that is acceptable for the longterm.
: Clone owners already have good choices for operating systems and if they
: themselves become orphans in the next couple years, they have no reason
: to fear the march of progress.

Progress is like the HP/INTEL new architecture that is 100 percent hardware binary compatable with the x86 series, but yet offers new technology!

: IBM would not be going RISC unless they saw the end of the line of the
: Intel x86 series.

Come on dude, I cant believe you actually believe the above statement. How long have you been using computers?

IBM is going Power PC because they are losing money against competition such as compaq, Gateway 2000, etc.... They are getting pushed out of the market and they are trying to re-gain the edge they had in 1981. They are trying to make a statement of "We are different", just like those teenage dudes that have blue and red hair with nose-rings you see around the U.S.

What you said above is in Ignorance in the computer community.

: I just think the 'aint-broke-don't-fix-it' attitude doesn't work in the
: computer industry, and after this huge period in computer stagnancy, most
: people won't look back at MS-DOS/Windows with fond memories, nor will

: they regret not being able to run whatever minority of code won't run in
: emulation because far greater glories await and they will forget the
: past--at least far more likely than they will forget the charm of the
: 8-bit machines. Even the games which everyone loves on clones will
: likely be done again far better on the next generation of machines,
: something which has not been the rule with 8-bit games.

Source record: 95643

Hi folks,

I've been lucky enough to pick up a working 130XE at a local thrift store. Unfortunately, it was in the usual thrift condition - filthy, no docs, packaging or software and dumped in a box (there must be thrift store guideline somewhere that states this must be the official handling of computers and software). Is the only difference between this and the 65XE (which I have a manual for) the additional memory? Replies appreciated.

Thanks,
Allan

I can not read their minds, I can only speculate on what IBMs motivations are. I should hope that it is more than merely a marketing stunt. But if you want to put your money on the future of the x86 series, be my guest. I'm sure when the end comes, and it will be subtle when the switch takes place, but it'll happen eventually, it may bring down those who fail to see the end of the x86 dynasty and continue to throw money hand over fist to keep the leaky boat afloat when everyone is jumping ship. I admit a great deal of bias, because I wish with all my heart that all the horrible hardware quirks of the x86 line die their final death with the Pentium and I have no obligation to apologize for that viewpoint in this newsgroup. Anyone who posts anti-x86 rhetoric is banging up against an immovable object so I realize that whatever I say is going to be met with the usual flamewars and belittlement and I have no hope of changing anyone's mind, just as 99% of most debates don't change anyone's mind. I think it's telling that you actually get more Intel defenders from '8-bitters' than you do in MAC or Amiga newsgroups, but that attests to the current role of the 8-bit as a hobbyist and not a serious machine I guess.

204. THANKS FOR YOUR REPLIES

Newsgroup: comp.sys.atari.8bit

Source record: 95646

Well after my late December posting of a sarcastic thank you for all the support I haven't been given I received quite a few replies. Some of them were helpful others were misinformed and some were just attempts at having a go at me. I thank you all for your efforts especially those who tried to be constructive. I would like to take this time to address one or two of the issues raised.

I understand postal mail is not 100% foolproof and sending money is a risky business but I'm afraid there is no other way to go about it. I can't take credit card orders because the banks aren't interested unless your turnover is in multiple thousands and since mine is not even multiple hundreds I'm afraid its a non-starter. IMOs and Bank Drafts are acceptable (in UK pounds) but they will cost you much more to obtain, that is why I feel sending US$ is the best bet for USA customers, large amounts can be registered for your safety. I have posted around 15 parcels around the world in the last year or so and all have arrived safely. There was one problem with a Yorky that did a eight week grand tour of America before it ended up at the correct address eventually - so I feel postal mail is not as bad as it was several years ago, although the charges are pretty high!

My software range is quite small yes, but there is a mixture of new games and old classics. Lots of people say "if only them old classics could be made available again" and then when they are, no response! To be fair they have sold quite well in the UK, where they were hard to find originally. I am continually looking for more titles to add as well as writing software myself but the output of new software these days is tiny, as far as I know there are only a handful of people in the UK these days capable and willing to write commercial quality software. As for the rest of the world, I don't know.. Eastern Europe is still strong but most people there already have distributors.

Arena is one of my newer games, its a fair puzzle game with decent graphics and sounds and was written in late 1992/early 1993, to quote one other title, Draconus, which somebody mentioned was written in the late 1980s, how is that newer than Arena??

Advertising, I post regularly to the Digest and I have an advert in the new AC and also in the 8-bit Omnibus and guess how many replies I have had to the last two adverts (in the case of AC paid for adverts)? Well a big zero, so you can perhaps forgive me for being a bit down-hearted. I buy the software, pay for the advertising and get no response. I understand market demands etc, so it leads me to the conclusion nobody wants this stuff, which is fair enough but please don't insult my intelligence by telling me I'm not doing enough to

promote the software.

Anyway thats all I am going to say on the matter, I got the responses to the last posting and I am now aware of the situation. I will continue to support the Atari 8-bits, not because theres alot of money in it but because I enjoy it, its my hobby and probably yours too.

Hallo !

What kind of harddisk-controller is the best for the 8-bit Atari and which
are still available ?

Is it possible to boot DOS (f.e. SpartaDos) from harddisk ?
Is it possible to have more than one boot-partition (f.e. Sparta and My -
DOS) and (if it's true) how do I select the booting-partition.
How many partitions does SpartaDOS support and how do I use them ?
What's the CleanUp - utility for ?
How do I get the DOS-Files to Harddisk (HDINIT does not copy the files i.m.
o.) ?
Does the new Interface of FTE (MIO II) support two IDE-Drives (master and
slave) ?

Thank you for answering these boring questions

Matt

Yep, I wondered about this portion of text in the manual as well. I haven't
discovered a way to survive without killing other people either.
You can find Jewelery and Gems, but you find them only after you've killed
someone. You'll never find any stuff without being violent.
There MUST be some other way to survive. Does anybody know one?

America Techna-vision used to have SIO ports for the computers. Check them out. If that fails try Toad Computers (1-800-448-toad) or TOAD@GENIE.GEIS.COM.

I'll take it the Atari "PC/2" is an Atari IBM clone (I've never heard of the PC/2). If so, you're definitely asking the wrong newsgroup! This is for Atari 8-bits (400/800/XL/XE).

Alan,

The 130XE has additional memory as well as an expansion bus on
the back ... something the 65XE lacks. As a result, the 130XE is much
more easily expanded than the 65XE.

The 130xe has the extra 64k of memory, but it also has the ECI port on the back.
The ECI is essentially equivalent to the PBI on the 600xl and 800xl; it give
you access to most of the lines to the CPU (all the address lines, data lines,
IRQ etc) when used in conjunction with the cartridge port.

Along with the extra memory is a Freddie chip to handle those times that the
CPU is looking in one memory bank and Antic is looking at another.
Other than that, I know of no other differences, though I'm willing to be
proven wrong.

I have a 1200XL that I purchased from one the massive auctions advertised here. I am trying to get it fix up a little bit to do some light typing and game work.

I thought about hooking it up to the TV but was not partical.
I understand that the Commodore 1602, 1702 and 1902 are amopung the best choices for it.
I live in Germany will a German monitor of this brand work with the 1200XL I understand that it can work in PAL.

Will the cartitages from an 800XL work in a 1200XL?

And which diskdrives are the best to use with the 1200XL?

Lastly how do you attach a printer to the 1200XL?

Thanks

John

Source record: 95511

Does anybody out there know the format of a standard, uncompressed,
62 sector, graphics 15 Atari Artist type picture file?

More especially I need to find out the original colours of the
picture assuming they are saved with the file. I've looked at the
beginning and end of the picture data but I can't seem to find
them. Can anybody help. I use the following code from Turbo BASIC;

```
OPEN #1,4,0,"D:FILENAME.PIC"
BGET #1,RAM,7680
CLOSE #1
```

RAM is the address to store the picture data at.

I have tried using

```
FOR D=708 TO 712:GET #1,A:POKE D,A:N.D
```

in the appropriate places but without any luck.

I'd be grateful for any help you might be able to give me.

Hell, you should see some of the stuff that goes on in the UK. The
press over here are too good!! They don't care who'se toes they stand
on (as you've no doubt seen over the past couple of years - the royal
family and all).

Mind you, there is one particular paper that's a bit iffy to say the
least ... and it's improved a bit over the past few years. They
started off as a Sunday paper with stories like 'Alien found on the
moon'. It was something like that, anyway. They weren't journalists,
just story tellers! They didn't make an effort to find true stories.

Since then, they've become a daily and have cleaned up their act in
that respect. The 'news', however, is still pretty unique to this
paper. I bought a copy last week because my regular read (The Sun)
was sold out and it's still how I remember it ... one of the
headlines being 'Hunk Bonks Vending Machines' - not your average
everyday family newspaper, eh? In fact, there's so much female flesh
flashed in its pages it's just one step away from being a porn mag!
NOT THAT I'M COMPLAINING MIND YOU!!!
It's just that it would be nice to have some more mainstream news in
its pages.

UK Atarians will probably know which paper I'm talking about :-)

Anyway, back to the Atari ....

SURE! If you bother to read the manual CAREFULLY, you'll notice that you
can only become an evil character when you kill good AND evil people or
ONLY good encounters. However, if you want to remain an explorer with a
pure (good, that is) soul, you may ONLY be allowed to kill encounters with
an evil character, but before you do that you should try to talk to them
or do some business. If that fails, KILL THAT BASTARD ;) and you'll still
have a good soul. Hope this helps :) !

I used to copy carts with the "BUG/65" (not DDT) debugger that came with (well, WENT with; prob'ly it was sold separately; it's been so long I don't remember anymore) "OS/A+," which later became "DOS XL." Writing cart data to disk was easy -- the truly tricky part was getting the system into a state where the cart was present but not running! For of course, if the cart was plugged in at power-on, the cart, not the disk, would boot and you couldn't get into (in my case) BUG/65!

My solution wasn't elegant but it worked. I'd boot the disk without a cart plugged in, and get into BUG/65. Then move the display list and do a couple of pokes to move screen memory out of cartridge space. Then run a little ML routine that turned off all interrupts, and looped waiting for the START key, then turned everything back on and exited. At that point I would align the cart very carefully with the slot, push it in until it ALMOST made electrical contact -- then take a breath and firmly WHAP it into the slot. With interrupts off, and if the cart went in straight (not crooked, one end of the contact-strip a little ahead of the other), the system would still be up; press the START key, the little ML routine exits, and when you examine cartridge memory space, there's the cart. It is now trivial to write the cartridge data to disk either as a file -or- (one of the features I sorely miss in DDT) to an arbitrary range of "raw" sectors.

A few other details: on the 800 you needed to wedge the power-interlock switch so that you could boot the system with the cartridge-compartment door open so as to insert the cart "after the fact"; serendipitously, however, MY 800's power-interlock switch got stuck in the "on" position all by itself about a week after I bought the computer, so I personally never had to worry about (or wedge) this. :-) And on the 800XL, Atari added code to the interrupt service routines, which checks for a change in the state of cartridge presence, and reboots the machine if a cart suddenly appears or disappears! I get around THAT, of course, by booting the Translator or other "RAM copy of the 800 OS," before beginning the procedure described above. And finally, some early carts (Centipede, Asteroids) ARE copy-protected, and crash when run "as-is" from RAM; I was able to find and patch out the protection in those two particular carts, though, and run them from disk. (I presume it is safe to mention this, now that the statute of limitations has expired (next year it will have expired twice over!).)

So yes, cart-copying has a long and cherished history. Even here, over the course of the 7 years I've been participating, there've been a number of very interesting posts describing other people's innovative cart-copying gymnastics; I particularly enjoyed the one from the person (onetime Atari employee?) who booted a special program from CASSETTE

in order to "get in ahead of the cartridge."

Excellent thread, Joe.

I've told my story here before, so I'll be brief: an Atari 800 got me my first, best college girlfriend, back in 1981 at RPI (only at RPI would computers and girlfriends go together!). Basically, I was cruising the girls' dorm next door to MY dorm, one afternoon when, through a partially open door I spotted an Atari 800. Personal computers were still a bit of a novelty in those days; a few men on my floor had them, but to find a female with a computer was a genuine rarity. I was hooked on the spot. :-) I stuck my head in the door and said something inane about how "I noticed you have an Atari computer." To make a long story short, the computer's owner became my girlfriend for the next three years, and that relationship definitely helped shape me into the person I am today. It may sound silly and it doesn't go into great detail, but that's one of the "big" ways in which the Atari Changed My Life. :-) There were of course innumerable LITTLE ways, but that's not the topic of this post.

Chris

protection.)
Mr. Chiesea, Mr. Current earlier posted some information about the
copyright laws and an article in AC. The point I want to make is that
DON'T BE BRAINWASHED BY THE ASP! Copying your own software for your
own use IS LEGAL. Copy protection merely prohibits consumers from
excercising their legal right to archive their software, computer,
audio or video. Copy protection generally leads to an inferior product,
(won't run on some disk drives, video tapes break, can't install and
restore a computer program after a hard disk crash, etc.) And the
consumer is not told that the software they are purchasing is copy
protected enabling an informed purchase. Don't get me started.

233. Re: Atari Artist colour problems

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-10 23:13:56 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3ev4bk$rf8@nic-nac.CSU.net>
Source record: 95524

```
It seems for standard 62-sector images, the format is:

7680 bytes data, 1 byte background, 3 bytes foreground

So the code should be something like this:

10 GRAPHICS 15:SC=DPEEK(88)
15 OPEN #1,4,0,"D:filename.G15" :REM or PIC or whatever
20 TRAP 100
25 BGET #1,SC,7680
30 POKE 708,4:POKE 709,8:POKE 710,14 :REM greys for paletteless files
35 BGET #1,712,1:BGET #1,708,3
100 CLOSE #1

Programs like ComputerEyes and some simple utils. don't bother saving
palette information if the images all look the same (grey), which is why
I assume grey and then get the bytes if I can.

Yes, some programs do it differently, but this is how I've seen it done and
how I do it myself.

-- Just as a note, for lots of GRAPHICS 9 images, I've seen it done like
this!:

7680 bytes screen data
27 ([ESC])
hue (0, 16, 32, etc.)

It would be good to first say "Is the byte 27? If so, get another byte"
Then, "is the byte less than 16? If so, multiply it by 16" (In case they
said the hues were 0 to 15, not 0 to 240 (in steps of 16))

Later! Hope I helped!

Um.... Part of what's good about RISC is the small instruction set --
you can fit the opcode in just 5 or 6 bits, leaving more room for
operands. If you "combine" RISC and CISC, you don't get the best of
both worlds. You get a better CISC -- something like the Pentium.

If you're talking specifically about the x86 series, it's already
happening, with the Pentium. And yes, it's subtle, because they're
currently emphasizing compatibility with what's already out there
rather than what's new.

[...]
>great deal of bias, because I wish with all my heart that all the horrible

>I have no obligation to apologize for that viewpoint in this newsgroup.

The horrible hardware quirks of the x86 die when you move to their
32-bit, protected mode.

[...]
> I think it's
>telling that you actually get more Intel defenders from '8-bitters' than
>you do in MAC or Amiga newsgroups, but that attests to the current role of
>the 8-bit as a hobbyist and not a serious machine I guess.

Of course you get more Intel defenders from people who don't
necessarily use Motorola machines, and more anti-Intel sentiments
from groups who, by definition, use machines with Motorola processors.
You'd get more Intel defenders in Intel-oriented newsgroups than you
would here.

I save my sentimentality for the old machine, and for "serious" use I
pick what I see as the most useful machine. For many applications the
Mac wins out. (Amigas just aren't up-to-date enough anymore.) For
most applications, I see the Intel platform as the best, usually
because it's the most flexible. (I'm restricting this to reasonably

affordable machines, BTW.)

Sure, Motorola processors are great, but recent Intel processors are comparable, and the entire package is the most flexible you can find, mostly because the hardware is simple to put together (why go to IBM, Compaq, or Gateway when you can build it yourself?), the OS is easily replacable with a multitude of common alternatives, and the software is readily available. You can't find that combination anywhere else.

If I want to design an embedded system, I'll start with Motorola. If I want a computer today, I'll start with Intel (or maybe AMD).

238. Atari 8-bit Documentation Questions...

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-11 04:21:41 UTC
From: nagual69@aol.com
Message-ID: <3evmcl$85q@newsbf02.news.aol.com>
Source record: 95529

I have a couple of questions for all you Guru's in our midst:

Q.1] Are there real DOC files for Mydos45D or earlier, on any archives
or web pages? If so, where??
Q.2] Does anyone have an 8-bit memory map or Peek/Poke
Locations/Definitions
table? Or detailed 8-bit programming documents?
Q.3] ***-->Can they be e-mailed to me? ;)

I was also thinking of uploading an .ATR/XFD file to Umich with
the
following files on it: Mydos45D, SuperArc, Diskcom32, GOS, and a few
other
files. I reasoned that it would be a good base disk for beginning
XFormer Addicts. What do you think?

Toby Schmeling
Nagual69@aol.com

239. Re: Atari 8-bit Documentation Questions...

Newsgroup: comp.sys.atari.8bit

From: kendrick@zippy.sonoma.edu
Message-ID: <3evpku$e10@nic-nac.CSU.net>
Source record: 95530

MyDOS 4.50 documents should be in the ARC with MyDOS 4.50 at UMich.
MyDOS 4.53 is the latest version of MyDOS, but the documents are identical
(I think). It is at UMich, and it's a smaller file.
There's absitively, posolutely no reason to put ATRs or XFDs up at UMich,
because:
1) Those files are inaccessable to Atarians without PCXf or SIO2PC
2) Both SIO2PC and PCXf let you install single DOS files (as I'm sure
you know) and from there you can copy them to your own personal
ATR or XFD files through the Atari.
.. OR ..
You can use S2PC or AtarImg to copy files from DOS to an ATR or XFD
without using SIO2PC and a real Atari OR PCXf.
3) Finally, the standard disk-image format for the Atari is DCM.
And there is a DCM->ATR converter (DCM2DSK2.ZIP) for the PC and
of course the original DiskComm.3.2 for the Atari.
The Atari Peek/Poke locations are listed, completely, in Mapping the Atari,
available from Atari dealers such as BEST Electronics (I think), B&C
Computervisions (I think), and American Technavision (I'm pretty sure).
Also, Rob Funk (I think that it's him?) has been working on "reference
cards" about the Atari 8-bit; reference style things. He might have
beem working on "useful memory addresses" or the like. I still suggest
Mapping the Atari (XL edition, especially, although I don't have that one)
if you can get your hands on it! (Also get a copy of De Re Atari, another
very good old programmer's "tool.")

The main Atari 8-bit archives is "atari.archive.umich.edu" cd to "atari/8bit".

About WWW Atari pages.. yes, there are some. I have one address, but it
isn't handy right now, sorry. :) Many others will reply to you about their
pages though, I'm sure! :) (One of them contains the "reference cards."
One of them (the same?) also contains the Comp.sys.atari.8bit Frequently
Asked Questions (FAQ) file, and that is ALSO pretty useful. FINALLY, there's
my "Atari 8bit New User, Emulator Help" unofficial FAQ, available here,
just like the c.s.a.8 FAQ, as well as on comp.emulators.misc, and hopefully
up at UMich. The c.s.a.8 FAQ is at some "rtfm" FAQ. There are files at
UMich which will point you to it.)

Good luck! Happy 8-bitting!

I don't know about getting a 1200XL to output PAL, but it should be known that the 1200XL has the worst stock video signal output through the monitor jack of any of the 8-bits. You would have to do the Supervideo upgrade. It's totally unusable as far as I'm concerned, totally blurry and overdriven.

>in straight (not crooked, one end of the contact-strip a little ahead of
>the other), the system would still be up; press the START key, the little
(and so on.)

What I don't understand is: With a two cartridge machine, why do I have to go through such elaborate procedures to copy the cartridge. From my point of view, I could just put a programming language cartridge in my left slot, and the cart I wanted to copy in the right slot.

Then, I put a DOS XL disk in the disk drive. The programming language boots. I get the ready prompt. I tell it to go to DOS. I get the DOS menu. I tell it to dump the contents between the start and end adresses of the right cartridge.

There, I have a ROM image.

Why do I see other people with two cartridge systems going through more involved procedures? Am I missing something? :)

Thanks,
Wes Brown

249. Re: BIOS of Atari PC/2

If I recall correctly, the PC/2 is just a MS DOS 8088 clone with standard 8 bit slots. Assuming you have an 8 bit HD interface, load debug & at the '-' prompt type
G=C800:5
& hit return. This doesn't work for all cards, but should for the most popular.
Rick

251. RS-232 using SIO2PC cable?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-12 10:50:21 UTC
From: a00344@giant.rsoft.bc.ca
Message-ID: <3f31hd$4vb@deep.rsoft.bc.ca>
Source record: 95413

I'm about to build an SIO2PC cable to connect a trusty old 400
to my 486, but before I start this project I'd like to find out
if I can use the same hardware for RS-232 on the Atari.

I won't need DTR, DCD, or RTS/CTS handshaking for the purpose I
have in mind, and I won't need to interleave R: use with other
SIO use. The plan is to boot the 400, start the application,
then shut down SIO2PC on the PC and have the Atari talk to a
Unix box at a reasonable rate (ie 2400 bps). The Atari will be
just used as a controller with gadgets on the joyports.

Will the classic 'Rverter' R: handler work for this? Any gotchas
I need to watch out for?

If not, does anyone have an R: handler intended for this use, or
can point me at a schematic for a real Rverter cable?

If nothing else, how about source for the Rverter handler as a
place to start from? I used to do a lot of coding on the
8-bits, but it's been a few years.

Thanks muchly,

Tom Klok
tomtom@mindlink.bc.ca

I have a friend who did up such a beast - a modern 1 chip RVerter. It was
built around the same chip as SIO2PC, and it ran at 9600 with few problems.
I'll check what info I have.

This process will get an image of the program. But, for a 16k or banked
cart, it won't work properly; I remember pyschedelic designs on my 800 when
both carts conflicted.

Have you tried loading the game on more than one of the different computer models (800, XL, XE etc)? I had problems running some games on my 600XL (+1064) computer. Some games, for instance Datasoft's "Bruce Lee" (the tape version) wouldn't load. Using the 800 translator software didn't help. The game did work on a friend's 800XL. Some games did not repsond to controls, for instance Synapse software's "Pharaoh's Curse".

It could also be that some checking mechanism in the program erroneously believes that you're trying to use an illegal copy of the game, maybe the disk has been damaged.

ATARI 8-BIT SUPPORT FROM RICHARD GORE

ARENA XL/XE 64K Disk only PRICE: #5 ($10)
----- The full 50 level version of the excellent puzzle game that
was a demo bonus on Page 6's issue 66 disk. You must guide
a set number of balls to the exit by strategically positioning pieces
of wall. Good graphics and very addictive.

BUBBLE ZONE XL/XE 64K Disk only PRICE: #5 ($10)
---------- A fast blast em set on a grid being invaded by expanding
bubbles. Collect the tokens and see how far you can
advance. Original gameplay and top notch grpahics make
this a game of high quality.

JAWBREAKER 16K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
---------- Classic maze game based on Pac-Man, munch the sweets but
don't forget that important dental hygiene! Two
different mazes are supplied which were originally sold as separate
games. Double the value.

MOUSEKATTACK 48K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
---------- Another classic maze game, but this one involves you
plumbing the levels of Rat Alley. Addictive arcade
action with a simultaneous two player mode.

MAZE GAMES OFFER: Buy both Jawbreaker and Mousekattack in one pack
for the bargain price of #6.95 ($14)!!!!

GTRACKER XL/XE 64K Disk only PRICE: #6.50 ($14)
-------- A new sequencer program for Replay (or Parrot) compatible
digitised sound samples. You can construct your own digi-
tunes using your own samples. Supplied with several sample tunes, a
player program, 4 page manual and a free PD demo disk showing just
what can be achieved. Now also supports stereo playback of your tunes
on a suitable upgraded machine. We will also be releasing extra tune
data disks in the future.

SUPER PRINT LAB XE XL/XE 128K Disk only PRICE: #6.95 ($15)
---------- A new monochrome design and print program
developed for 128k (130XE type memory) users.
Features include the usual arrary of drawing tools as well as programs
to create icons, split a screen, mix 2 screens and a mini database for
creating labels. Printer support is included for Atari 1029, Epson
compatibles and the Atari 1020 in upto 4 colours!! Yorky compatible.

YORKY 256K MEMORY UPGRADE

A 256k memory upgrade that simply plugs into the PBI port of your
800XL (or internal 64k 600XL). NO soldering is required. Supplied
ready to plug in and use with all the necessary RAM chips, the manual
and a disk of support software.
VERY FEW UNITS LEFT. THIS COULD BE YOUR LAST CHANCE TO OBTAIN ONE.

PRICE: #50 +p&p (UK #2, EC #3.50, WORLD #5) or $90 complete.

I also have limited stocks of the following commercial software items.
The software items below are brand new, in their original packaging,
with English manual(s) and most are still shrink wrapped.

Halley Patrol (disk) #4.00 ($9)
Summer Games (disk) #5.25 ($11)
Cyborg Warrior (disk) #5.25 ($11)
Dropzone (disk) #5.25 ($11)
Solar Star (disk) #5.25 ($11) also known as Sun Star!

Gato (rom) #6.95 ($15)
Desert Falcon (rom) #6.95 ($15)

All software prices include postage and packing to UK addresses,
overseas please add #2 per order. Prices in US$ include shipping but
payment must be made in US$ cash (notes only please - no coins).
UK pounds are accepted in cash, cheque (made payable to Richard Gore),
IMO or postal order. Contact address:-

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW,
ENGLAND

any reasonable time at the weekends

E-mail: chmrig@leeds.ac.uk

Coming soon..... new software from Germany, Golf Tour 94 (maybe 95!)
and more. Updates will be posted to the Digest.

Okay now with the recent discussions as regards posting large lists
of stuff for sale, do you the Digest community object to me posting
this message of what I have for sale?? If the majority do then I will
cease posting them.

My own personnal feelings are these type of postings are fine so long
as they are not too long, no more than a couple of screens say, and
relevant to the news-group in question c.s.a8 in this case.
After all without advertising vendors will never sell anything and
buyers will never know what they can buy.

I understand peoples objections especially when they have to pay for
e-mail. From the UK point of view, most of the people with e-mail will
either work for or study at a University/college and thus receive free
e-mail, with only a small proportion paying for it via compuserve or

any of the other companies who have recently started in the UK.

Okay I've stated my point of view, so if you want me to stop my postings just let me know. By the way I only post the full list once or twice a month anyway so I'm certainly not clogging up anybody's bandwith or hard-drive space.

RICHARD GORE

[Tales of cutting holes in disks removed]

As I recall, those neat little widgets that cut notches in disks so
you could use the flip side came in two versions, one of which cut the
index hole as well as the write protect notch. So if you're lucky and
manage to get hold of one o' them things, you may not need to butcher
your disks to format the flip side of a disk on an XF-551.

Omnimon in an OSNXL OS, 'Impersonator' with a dummy cart from Alpha Systems, 'The Pill' from CSS, the ml monitor in the BB, these are the ways to copy carts. Many will still require some dissassembly and modification. Even the banked carts can be copied using schemes that use extended memory machines.
Somebody mentioned 'Bruce Lee' would not work on his computer but would on somebody elses. 'Bruce Lee' commercial tapes and disks will not work if an 850, P:R:, MIO or BB are attached to the machine.
Another great copy protection innovation. I had a program the other day, 'Grandma's House', it wouldn't run if a second disk drive was on line. What a crock of stinky (as my grandkids say.)

>But then the whole thread fizzled out and I didn't see anyone come up with the
>definitive composite to RGB converter solution. Did I miss something ?

I thought that thread was about using old PC monitors for the
Atari. An IBMPC type CGA or EGA type monitor is TTL, not analog,
and hence is inherently incompatible with any conversion of an
analog based signal such as the NTSC signal of the Atari without a
great decrease in resolution.

An IBMPC type VGA monitor is analog, however. The trouble with
these monitors is that the scan rate is not able to be switched to
that used by an NTSC signal. Some (not most) Mulitscanning
montiors can go down as low as the NTSC 15.7 KHz horizontal rate,
but most will not go below 20 KHz (somethinlng like 25 or 28 KHz
is a common lower limit).

Thus, in general, a scan rate converter would be required, a
fairly much more complex and expensive project.

> There seems to be several ways to solve the problem if an off-the-shelf
>solution is not available -
>1. Find the circuit for an existing converter - one that produces the correct
>colours.
>2. Find a circuit for a composite monitor and figure out how it does it (on
>account of it has to drive an RGB tube in the end).
>3. Find out what a composite monitor signal is, and design a circuit to decode
>it.

Yeap ... all of these work, and a literature search in the
library would turn up several examples of circuits to convert from
NTSC to RGB. Such a project is on my long term wish list as well,
as then I could send an NTSC signal to a switchbox with my IBM VGA
type monitor (multiscan).

These are also available commercially, I believe in the 80-100
dollar range, though I cannot recall any specific models.

The problem is, that even given an NTSC to RGB converter, you
still need to have a monitor capable of scanning at the correct
NTSC rate.

> BTW, is the composite signal the same for PAL and for NTSC - i.e. does
>the modulator add the PAL/NTSC specific information? Or do we need a different
>composite -> RGB converter in Oz than in US? Can anyone out there help? and
>how many others are interested in a solution (If there are a few then maybe
>it's worth putting a bit more effort into it).

PAL is different in inherent format -- different scan rate, and a
different frequency for the chroma carrier. I presume that the
same modulator could be made to work for either, with the possible
problem of the sound carrier (which may and probably is different
in specifics) but for video only the same modulator could work, I
suspect.

Another project that may be more useful would be a NTSC (or PAL)
to separated chroma/luminance circuit, with S video compatiblility
in mind, though in the Atari it is much simpler to just add such an
output by internal wiring additions and changes.

I only managed to get one character to survive by being good. It's tough, but not imposible. The a few keys: Go out at night during bad weather & never stike the first blow. What happens is the bad guys mostly just come out at night & the best junk, potients/weapons/armor, is carried by those guys. Always hang out right next to an Inn so if your HPs drop, you just go inside to recoup. Since you've been decent to most of the honest folk, you can wander around during the daylight hours to do your shopping. Charming anything or anybody is not good at any time. I never start a character with less then 220<?> gold. If the character has good charisma, that is enough to get a dagger <lowest priced weapon if you barter right> and a nights logging in one of the flea bag inns. Always eat some food as soon as you start the game. You're easy pickings, but they can't steal what you've eaten.

264. ROM files & PC Xformer 2.5

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-12 21:47:05 UTC
From: bwbwn@rice.edu
Message-ID: <3f480p$534@larry.rice.edu>
Source record: 95554

I can usually get a clean image of a cartridge. That's not the
hardest part. Loading the cart is the hard part. :) But, if I
transfer the 8K ROM image to the PC via SIO2PC, I'd believe
that Xformer takes care of setting the image to virtual ROM. :)
I thought a little about how these cartridges would protect
themselves: Simplest way is to simply zero the addresses
where the ROM cartridge would go. If it's RAM then the image
self-destructs. :) But, if it is ROM, it can't do it, and continiues
loading. Now, if I have a good image, and load it into Xformer,
I'd believe that Xformer changes that address to ROM, cracking
the copy protection. This is how I've seen some esoteric hardware
cracking done.

My question is: I transfer the ROM image to my SIO2PC disk,
and load the disk containing it in the emulator. How do I transfer
the ROM image OUT of my Atari disk image into the DOS filesystem?
That's the only way PC Xformer would do it.

Also: What seems to be the problem with copying bank switched
cartridges? I've talked to my father, and he thinks that if you get
an image of the bankswitched cart, before it loads, Xformer would
handle it. Something to think on. Will this work? :)

Thanks,
Wes Brown

Any good terminal allows you to exit to DOS without hanging up. I know Bobterm and FlickerTerm do, which is why I don't see the lack of file Xfers in Flick as being a major problem. Some terminals require a reboot in order to get to DOS, like Backtalk. I had that bullshit. If you are on floppies I could understand how going back and forth between terminals could be inconvenient, but it's no biggie with a hard drive or ramdisk.

Source record: 95407

I'd have to agree that the 1050 was the "best" one made....

A 1050 seems to be built better than the other drives. When I went to buy my first 810, I was disappointed that the military BX was sold out of 810s...but they promised me a 1050 (when it would arrive...eventually) for the same price. I didn't even know what a 1050 was at the time, except for a picture they had.

I remember that in the description of the product Atari was advertising (their sales brochures), I always thought it was funny that amongst the list of features, they'd list something like "Styled to match the Atari line of home computers." or "Styled to match the XL series." I was pissed that my 1050 didn't match my beige 800. I didn't even know it could do "dual" density because it came with DOS 2.0s. Then they sent me DOS 3 and after I converted everything, learned that it sucked. Wilkinson had a type-in in Computer that changed 2.0s to do what 2.5 eventually did...except Wilkinson's would actually list 1040 (or whatever) free sectors instead of that 999+ bullshit.....

Anyway....the point is that after all those years, the drive is still working and hasn't given out ONCE. (It's changed hands a few times and come back to me....heh)

On 12 Jan 1995 08:41:47 GMT, William Kendrick (kendrick@zippy.sonoma.edu) :
:So far as structured languages go on the Atari 8-bit, I (and others, I'm sure)
:highly recommend Action!, even over C compilers. C is just a bit much, it
:seems, for the old Atari. With Action!, you have more control over the
:Atari right away because it's an actual Atari language (graphics, sound,
:controller, file I/O, etc. routines are all built in are easily available).

You are right, in that as far as structured languages go ON the Atari 8bit
the best and perhaps easiest to use is Acton!. I although prefer to do my
coding in Machine Language ON the 8bit. I use Mac/65 since it seems to
work better with Sparta-X than other assembler editors.
BUT! If you are talking about structured languages FOR the Atari 8bit,
but not neccessarily running on the Atari 8bit, then the best by far
is the Cross Compiler version of CC65. What I tend to do mostly when
producing final version of code is to through the C code through CC65
and then look at the .M65 machine language files it produces and do
my own optimization on those. Once done with that, I through it through RA65
and then Link it - Test to see if it runs (after downloading program), If
it runs then I go into the source code and place my custom mods in there
via #asm and #endasm.
Can't get much faster on developing, specially when you're so used to
writing in C for Unix systems.

270. Re: was the 7800 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 00:55:23 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3f4j1r$lad@ccshst05.cs.uoguelph.ca>
Source record: 95410

```
: The 7800 was definitely the most advanced machine when it was completed
: in 1984, but by the time it hit the scene, it was just an also-ran.

In many respects it was superior to the competition ... namely
animation capabilities. Wheras the NES and SMS had major slowdown and
flicker problems, the 7800 did not. It had higher resolution than either
the NES or SMS and could display more on-screen colors than the NES. In
terms of sprite control, it was unbeatable in the 8-bit arena.

274. ***Misc. Atari hardware for trade or sale***

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 03:11:41 UTC
From: James King <jeking@xmission.com>
Message-ID: <3f4r1d$585@xmission.xmission.com>
Source record: 95415

I have the following Atari 8bit hardware for trade or sale. As usual, I prefer to trade, rather than sell outright. If you have no trades, then by all means offer a REASONABLE purchase price. Unless otherwise noted, all items are in MINT, CLEAN condition.

2 x Indus GT disk drives w/original carrying case, PS and one I/O cable
3 x Atari 1050 disk drives (SD/ED), PS and one I/O cable
2 x Atari 800xl CPU's w/PS and one I/O cable
2 x Atari 130xe CPU's w/PS and one I/O cable
1 x Atari 65xe CPU w/PS and one I/O cable
7 x Seagate ST225 20meg HH hard drives (preformatted on MIO)
1 x ICD (now FTE) 256kb MIO, PS and one serial and one parallel cable(s)
1 x Hayes 2400 baud Smartmodem w/PS and one PC serial cable and one Atari cable
1 x Atari XEP80 80 column display device w/PS
1 x Atari 130xe upgraded to 320k w/XE touch keyboard and MUX disable switch
1 x Orion Micro System Express! cartridge w/documentation
1 x Action! cartridge w/supplemental diskettes and documentation
1 x Mac/65 cartridge w/documentation
1 x Atari 1200xl w/PS and one I/O cable
1 x Atari 800 w/PS and one I/O cable
1 x Atari 835 acoustic modem (brand new in box)
1 x Atari 1020 printer/plotter w/extra pen refills (about 5)
1 x Okidata 9pin printer (requires printer adapter)
1 Atari 850 serial/parallel device w/PS and one I/O cable

Have no fear.. these are merely EXTRA diddies accumulating in my "garage". If I dont clear these out soon, somebody may be tempted to break in and STEAL them! <grin> My collection is much larger than this, and I could probably start my own BEST electronics clone! <grin>

276. Let's talk SIO2PC!

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 04:48:13 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950112203539.1362B-100000@CSOS.ORST.EDU>
Source record: 95417

I'm dying to get one of these things up and running. Since I have no skill at electronics, I think I'll have to contact Nick Kennedy to get one pre-fab.

I wish that I would have known about SIO2PC last year, before I sank a bunch of dough into a Black Box/Floppy Board combo. I paid somewhere over $300 for the BB/FB with a case, and serial and parallel cables. I then bought HD drive mechanisms, and an "embedded" SCSI hard drive, and a nice slimline PC case to put it all into. I never could get things to work right. This is a topic which has me pissed off yet even today, and I will DEFINITELY get back to posting on it....but for now...SIO2PC.

Is it possible to use larger disk images than single-sided, single-density? It would be nice if SIO2PC sported the ability to emulate 8-bit hard drives, at least in size. Is this the case with the latest versions of SIO2PC? Also, can the PC's modem and printer be used from the Atari, and what about the dilemma between the Atari requiring just a CR and the PC requiring a CR-LF on the printer: How is that handled?

If anybody would please post about their successes (or failures) and suggestions for SIO2PC, I'd greatly appreciate it.

James Wood

(I don't have one of those quoting editors, so I'm using a
word processor.)
RG>DON'T BE BRAINWASHED BY THE ASP!

MC>What's the ASP? Did you mean SPA (Software Publishers
of America)?

(my opinion)
I guess so. Yes. Did you see the fraudulent ad, placed by
the SPA a few months ago in 'TIME' magazine, that stated a
bald faced lie that copying copyrighted software was
illegal.

RG>Copying your own software for your own use IS LEGAL.

MC>Unless specifically prohibited by the rights owner.
Random example: If you bought a copy of Bank Street
Writer, you were prohibited from making yourself a
backup copy, but permitted to buy a second copy for a
"nominal" fee.
If there's nothing but a copyright statement, you are
free to make yourself copies for archival purposes, as
you say. Independent of whether there's copy
protection employed.

I've never heard of a test in court of software producers'
legal right to write their own laws inside software
packages. Or put a little differently, a test of software
producers' ability to enforce a one sided contract like the
ones commonly found inside software products, with no notice
on the outside of the package that a lengthy contract is
inside the package. Many try to get around the law with the
'Open this envelope and you've agreed to our terms.' or
'Open this package and you now have a license to use this
software, upon which we place all kinds of ludicrous
conditions.' (Something to that effect.) I am also unaware
of the legal precedents in cases involving a person making
copies for their own use of software they've purchased,
regardless of what terms the software producer tried to put
inside the package. I am confident that nobody has EVER
been successfully sued for this. I also disagreed with M.
Current's surmise that 'Analog' owner Larry Flynt could
change the conditions of copyright which existed when I
purchased my 'Analog' magazines.

RG>Copy protection merely prohibits consumers from
excercising their legal right to archive their software,
computer, audio or video.

MC>Prohibits? Slows them down, yes, but any copy protection
can be circumvented if you work at it enough.

The large majority of software users cannot crack copy
protection schemes themselves and are virtually
(thesaurus used here):
prohibited (from doing)
denied (their legal right to do)
proscribed (from doing)
refused (their right to do)
that which is perfectly legal to do.
(I really WILL try to shut up about this.)

Yes, there are similarities, but just because a gfx chip has a similar
mode doesn't mean it's the same. My Amiga has a 1 bitplane 320x200 mode
that could look identical to a 400/800s gr.8. But how it generates video
is different and incompatible (although it is indeed a true descendent of
Antic/GTIA).

Yepperoonies... you can make up to 65536-sector disks (16MB if Double Dens)
all the way down to like 48K (MyDOS gets pissed if there's not root directory
ya know :)).

You can redirect P:rinter output to:
IBM screen
IBM printer
IBM file

It lets you set up 7th-bit-off, ATASCII->ASCII TAB, and ATASCII EOL to
CR or CR/LF if you want. (No PC modem support.)

You can also install files from on the PC's drives and read them as though
they were another disk drive (locked, with one file on it, and the sector
count and free-sector count is messed up.. why, god KNOWS.. I mean, it's
not difficult to say "00000" for free, and convert the size into an SD
sector count (divide by 128)! <complain complain>)

ANyway, yeah, it is a dream come true.. I just wish MyDOS would support
UltraSpeed I/O, damnit.. (DON'T >ANYONE< TELL ME TO SWITCH TO SPARTADOS!)

Good luck with it! I'd look around for used SIO2PC cables or deals from
folks who're strange enough to sit around and built a whole bunch of
spares (you know who you are :)) before shelling out the $50 for a premade
one from Nick himself... (unless his price has dropped?)

Yup I'm still here...

The storms here in CA had taken out the power lines behind the building.
It's really hard to get on the computer without power!!
The phones here are also cordless, and when the power goes, so do they.
Needless to say, I'm stocking up on candles and some REGULAR phones...
Am frantically trying to get caught up, and should be back in sync
by the beginning of next week. Mike

287. SIO2XL!?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 09:45:42 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950113014619.20406b7d@sonoma.edu>
Source record: 95428

Now, I'm tired, and was about to go to sleep, but then I started thinking
for I don't know WHAT reason of the following idea:

Wouldn't it be possible to hook up an SIO2PC cable to an Atari 8bit
via a Black Box, P:R:Connection, Atari 850, or R:P:Connection (WHEN
it comes out! :(:(:( ), and then to another 8bit via the SIO side
and then make the one Atari act like a fileserver!?

Sure, it's useless (more or less.. for folks with two R: ports, it'd be
a cheap MUX alternative if they want two 8bits sharing files), but
isn't it completely possible!? We have all it needs, except SIO2PC
software for the Atari (hence, SIO2XL)!

Am I mad?

Well, yes, of course I'm mad, but.. anyone have comments on this insane
idea!? :)

Raining ... again

288. Damn, I forgot.. but while I'm at it... FlickerShade

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 09:55:23 UTC
From: KENDRICK@sonoma.edu
Message-ID: <950113015600.20406b7d@sonoma.edu>
Source record: 95429

Well, I HAD two posts to make, one about SIO2XL.. that's done, but the other evades me. So as I sat and thought I remembered I was working on a "FlickerShade" mode again.

What's FlickerShade? Well, other than having a poorly done rip off on FlickerTerm 80's name, it's a simple VBI which flips between two fonts (sound familiar) and an option set of two palettes.

What does it do? Well, it acts like APAC mode (the name I came up for it is "IRGAAP16C" - IRG; Almost Any Point, 16 Colors) if you set it up for one font having the shade information for the characters, and the other font having the hue information for the characters, and obviously flipping between them.

An IRG-ColorView mode (64 colors) was made by Itay Chamiel and is used in his Tetris game "The Wall." (heh, Itay.. as if we needed ANOTHER Tetris game! I should talk, of course.. esp. with plans for ANOTHER Tetris game (or even a disk full of them!? :) :) :)))

Anyway, that's beside the point. I guess this post is mainly egotistical "look what I've done" babble, but it's also an encouragement to programmers out there to try something ... well, not quite NEW (others have played with it, at least with Graphics 0, and of course Itay made the ColorView equivalent, and THEN of course the ORIGINAL ideas date back to APACView, Jeff Potter, and wherever he got the design from (someone in an ANALOG magazie article?)), but RARE. Sure, we all know how to do DLI's to add colors, increase the number of player/missiles, etc., but these can get complicated (so far as designing what parts of the screen are useful for what in a game or application). (Actually, damnit, I wish we had a MARIA chip! :))

Soooooo..... I guess I'm totally wasting bandwith, so I'll shut up. Anyone interested, have comments, anyone else try this and succeed (or, especially, fail) ??

Later!

Why not use a simple null modem cable? Let the send/receive lines cross and
modify the SIO routines on the server side to let it send raw bytes back to
the client. Then it would be relatively easy to write a drive simulator
for the server side. This aproach will save you the cost of two interfaces
and a SIO2PC cable...

: WHere can I get a copy of this and how much will it cost me?

: Also, I heard "print out of OS" and "43 appendicies".. can anyone summarize
: it, tell me when it was printed and by whom, etc??

: Follow this posting (ie, don't e-mail) cuz others seem pretty interested
: in it too..

I've got a copy of this (it's good!), I'll try and find out the details.
It's published by Tyne and Wear Atari User Group in England, but that's all
I can remember. If someone wants to post more details first, then that'd be
fine.

Dear Atari 8bit users,

in this group I always can read about many things, which sound great for me: memory extensions over 1 MB, connecting harddisks to 8bit Ataris, circuit extensions etc. But I can find no closer info at Internet. Can anybody help me, where have I to find informations about these things?

Tommy Madaras

: He's still around. I got mail from him the other day (he seems slow to
: reply, but he's been busy finishing up some manuals, I think.)

seems _very_ slow to me,
i'm still waiting for a reply on my msg of 29-jun-1994 !
he said he would go over my message and get back to me.
nothing heard of him since.. guess he has a lot of manuals to finish :-)

Charles..

I just got one, and want to know what games are available. Is Wizard of Wor one of them? I hope so!

295. GOLF TOUR 94/95

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 15:54:50 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <9799CB74EFF@east-01.novell.leeds.ac.uk>
Source record: 95436

In response to the interest shown in this game (GOLF TOUR 94/95):-

It was going to be called Golf Tour 94 but got delayed and now since
its 1995 its probably best to call it GOLF TOUR 95.

I am not programming it myself, it is being written by the chap who
wrote Bubble Zone and Arena. Work is still being done on it, I will
give more details once the game is ready.

The price will be around #5 which translates to about $10, this is
pretty much a standard price for new disk games software in the UK
these days, well from me it is anyway. Utilities usually cost more
because they usually take longer develop and need larger manuals,
which in turn means more copying and higher postal charges!

I hope to be able to upload software soon and I have demo samples of
GTRACKER, ARENA and SUPER PRINT-LAB XE that I will try to get onto
the archive, note I said try - I can't promise anything heres the
process I have in mind, can anybody let me know whether or not this
will work, either in theory or in practice (ie has anybody done it
this way):-

1) Diskcomm the 8-bit disk into one file
2) Port this file over to the ST via ST Xformer - 3.5" disk
3) Read this 3.5" disk on a 486/66 PC, uuencode it and e-mail it
too.... Heres a question where do I e-mail it too??

This course of action makes several assumptions, all of which I hope
work, but I'd be grateful for any advice:-
i) Can a PC read an ST disk - i have heard it can in 720k (DD) format
ii) Where can I get a ready built ST Xformer, is there an ST Xformer?
I'm sure I've heard of it but I could be mistaken.

I don't own all these machines its a case of copying disks and taking
them to work, reading them and e-mailing.

296. Re: Let's talk SIO2PC!

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 17:20:13 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <130931@cup.portal.com>
Source record: 95437

It's easy to create 16 meg drives with MyDOS/SIO2PC, I've had trouble with creating them from Sparta DOS but Sparta can use a MyDOS created disk. The main problem you may encounter is speed. The SIO2PC is a lot quicker then a stock drive, but I've had trouble getting it to run in high speed. From what I've heard, any working PBD hard drive should be much quicker. The software has a print through mode, but I've not heard of people using the IBM's serial port for bbs'ing.

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

Vendor = reseller of products produced by others
Developer = producer & copyright owner of products
Publisher = publishes a print or disk magazine

All commercial vendors, developers, and publishers should be listed here.
"Major" shareware developers should also be listed.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
```

CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a
Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply
Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at
confirming the entire contents of this list in 1994!

298. 8-Bit Atari Emulator for PC?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 18:43:33 UTC
From: ah929@FreeNet.Carleton.CA
Message-ID: <D2CxCL.IE2@freenet.carleton.ca>
Source record: 95439

Does anyone know if there is an emulator for the PC?

299. Re: Asylum

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 22:00:28 UTC
From: mcurrent@blue.weeg.uiowa.edu
Message-ID: <3f6t5s$4aor@blue.weeg.uiowa.edu>
Source record: 95440

ntricht@cip.e-technik.uni-erlangen.de (Norbert Richt) writes:

>Last week I pluged in my old but good atari 130 XE and played Asylum just
>as I did years ago.
>But not surprisingly I did not manage to complete this game.
>The End could not be far, but there are a few problems which made me nearly
>crazy.

>Do you remember this game ? How do I get the bomb ?
>What about the machine ? And how can I escape ?

I wish I had made games list handy. Could this be Alien Asylum, by
Synchro? Hope I got that right. It's one of the handful of pirated
games I've never found a legal copy of.

This game I'm thinking of is in some character-based mode, and you
control this little white guy, maneuvering from screen to screen. There
are only a few different kinds of screens. Besides avoiding the nasties,
you can collect crystals of a few different colors. You can pick one up
and put it down somewhere else, but you can't carry more than one.

The action is very slow, and without any instructions to help I never
really figured out what I was trying to do.

Anyway, does this sound like the game you're talking about? If not, does
anyone know what I'm talking about?

300. Re: Composite to RGB - was it solved?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-13 22:28:17 UTC
From: BRYEDEWAARD@news.delphi.com
Message-ID: <3f6uq1$que@news2.delphi.com>
Source record: 95441

I do not know of a way to correctly hook an XL to an RGB monitor. I have
been working on design to do this, but none have been satisfactory. The
only working one I have built "copies" the circuitry of a composite
monitor to basically turn an RGB into a composite along with the loss
of quality. If I ever get my other design working, it will be much nicer,
but will probably require modifying the computer.

PAL and NTSC signals are quite different in the way they represent color.

-Bry

301. Re: (Revised) Copying my ROM cartridges.

Newsgroup: comp.sys.atari.8bit

Russ Gilbert <Russ.Gilbert@apk.wariat.org> writes:

>inside the package. Many try to get around the law with the
>'Open this envelope and you've agreed to our terms.' or
>'Open this package and you now have a license to use this

One thing I just saw today in regards to this,which I think
is completely ludicrous: We just got a Compaq computer system in at
work, and on the SYSTEM BOX, it says "Opening this box signifies that
you acknowledge and will comply with all license agreements to all
software contained herein, including all software "pre-loaded" on the
hard disk drive". That is ALL it says. It does not state these
license agreement's provisions. So, in opening the box, you have
NO WAY OF KNOWING WHAT YOU ARE AGREEING TO! There isn't even a
provision such as some companies use like "To get a copy of the
license agreements, ask your vendor". Amazing. Lawful? I have
no idea. If anyone who has knowledge of this area of law would
like to let me know whether this sort of thing is legal, I'd
be appreciative.

-Joe

302. Re: How Atari Compuers Changed Our Lives

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-14 01:45:28 UTC

Get ahold of PC Xformer by Branch Always Software. $29.95 for v.3.0 (first commercial release and best compatibility).
v.2.0 and 2.5 are free and can be FTP'd from atari.archive.umich.edu in the atari/8bit/Xf2 directory (and other FTP sites in other places).

Good luck. Be sure to check out my unofficial Atari 8bit New User, Emulator Help FAQ (rev.0.6) ~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~~~~~~~~~

Some things I'd like to say about AR: :)

(1) The Dungeon's manual is great (funny, too)
(2) In the city, he used the top half of the 3D screen area, and then redrew it backwards beneath, then used DLI's to cover up text over doors, the horizon (mountains) and to make the bottom look like dirt and the top like sky. Very sneaky.
(3) The 3D scrolling is MUCH smoother than I remembered! I thought it'd be blockier (like you see in most 8bit 3D games, like AMAZing, or Amazing Maze or whatever it's called).
(4) I got chills when the UFO started ascending in the City's intro.
(5) I thought the Dungeon's graphics were going to suck.. until I noticed the "Actual Commodore Screen Shots" below the pictures on the box! :)
(6) I'm happy- I think I can make a backup copy of most of the disks onto SIO2PC! :)
(7) If you don't have this game, get it.. Even if you don't like RPG's, it's worth $6 just to see this game.
(8) It could be done better though (muhahah) ... but it'd require 5 times as many SD floppies! :)

Does anyone have any books on Atari 8bit assembly language programming for sale? My mother seems to have thrown mine out about seven years ago.

Also, the user manual for Assembler Editor would be helpful.

Thanks.

In David Richardson's "Daisy Dot III Users Guide," he included some fonts converted from Print Shop Icons. He said they (at least some of them) were "provided by John McGowan, who converted them from PrintShop Icons with a program that he wrote called PSTODD3.BAS. It is a public domain program and it works very well. Once the program is loaded you are asked which disk drive is the source (the PrintShop disk) and which is the destination (the font disk). You must know the correct name of the PrintShop Icon. It is then converted to a DD3 magnified font. The converted icon takes up to three DD3 characters. Since there are ninty characters to a font, you can have up to 30 icons to a font. Doing this, however, would create a huge font file, over 300 sectors according to documentation. Mr. McGowan recommends limiting each font to from five to ten icons. Since DD3 accesses each font from the disk each time it needs to print it, this means that every time a 300 sector long font is accessed, it must load the entire file, even if only one character is used." [etc.]

I hope that helps! (Sorry, I don't recall where to GET a copy of this program though. I don't even know if I ever HAS, as I never had PrintShop, nor do I used DDIII any more (I have no printer.. for ANY computer! <sigh>))

Was anyone out there fortunate enough to get to go to Atari Camp
by Mom & Dad? I went to the one in San Diego in '84 or so...Looking
back I have to laugh a bit (some of those kids dragged their 800XL's,
big 810 drives, software, etc with them to summer camp...what happened to
roughing it?).

Anyways, got my first taste of pirated games there (had to pay a kid
$5 for Zaxxon, among others I believe). It was a fun experience at the
time.
Weren't many girls there, though...Hmmm...

I know for sure I tried to make illegal copies of some disk games
from Adventure International in the early days, but I don't remember
what happened if the pirated copy didn't work (they never did work). If
you have original copies of other games from the same company, disks
that really work, maybe you should make a non-working illegal copy of
one of them and see what happens. I can imagine they used the same copy
protection scheme and behaviour for several games. Maybe some other
game in the series also enters a demo mode similar to the one you've
seen in Triad.

Btw, those Adventure International all have Scott Adams' signature, don't
they? Just to check that we're talking about the same games, these are
the ones I remember: 'The Count' and 'Questprobe'. Without
graphics: 'Mystery Fun House', 'Adventureland', and 'Mission Impossible'.

Hello !

Yesterday I picked up an Atari 800 (not so easy in Germany), but there are
some problems with the hardware.
If I switch on the computer the memo-pad is not running and with a plugged
in Basic-cartridge it also wont work correctly.
But my Caverns of mars car. work very fine !!!
So I think, something of the ROM-Cartridge (CX801-if I remember correctly)
is wrong. (There are fitted two 2764-EPROMS to the sockets and you can
switch between them - I guess, there are busted)
Now my questions : The three ROM-Chips on this board are originally 4KB
ones, aren't they ? Is the pinout compatible with normal 2732 EPROMs,(it
seems to be , but I'm not sure) ?
And if this is right, could anybody tell me where I could get burning-files
for the 800-ROMS from (UMICH?) ?
It would be very great to get this beautiful machine working !!!
Thank you very much .

Matt

P.S. 600 XL 1, 1064 1, 800 XL 320 k 1, 1050 2, 1010 1, 410 1, 800 1/2 8-)

Bad character editor. Although I thought the characters wouldnt load
if you they got messed up. The fbi comes if the protection on
disk 1 side 1 isn't decoded properly. It is also interesting to change
the first few bytes of the boot sectors (even comes up with a header
screen thank you for pirating the software.)

Whoa whoa whoa. Rick, explain about the 12V "falling out" to me.
If you mean the brick (between the wall and the 1050) I have a spare.
If you mean something INSIDE the 1050, then 'could be, since I've used
both rarely in the past months until now.

Then again, I HAVE been only using one of the bricks, so I'll test them
out with the spare. If I can wander around AR for more than about 15
minutes then it was the brick..

'course, I STILL have this itching feeling that it's something inside my
1200XL...

hmm

Glenn Saunders <krishna@primenet.com> writes:

>Puff is probably the most reputable 8-bit supplier in the history of the
>platform. If you don't trust him, noone will please you.

[snip]

>Bob Puff told me, I believe, when I was speaking to him, that he would
>continue supporting the 8-bit BEYOND the point where he was only breaking
>even and would continue even if he were taking a loss until he couldn't
>handle the debt anylonger. That's dedication.

I do appreciate all those who support the 8-bit market, and
do not begrudge ANY profit they can make.
However, I must say that the only dealing I have had with Bob
(other than registering BOBTerm) was a complete failure. I called CSS
and spoke to a woman there. I ordered BASIC XE, which I wanted to give
as a gift at Christmas. I paid with VISA.
Subsequently, I found one cheaply and purchased it as well, figuring
having a second copy can't hurt. [G] Well, to make a long story short,
the cart never came from CSS. I wasn't billed either, thankfully.
No, I never called back to re-order. My incentive to do so was
gone by then, as I explained above.
However, the fact that theyaapparently lost my order is the point
of this story. I would say that he would be less close to being in debt
if every order that was placed was filled!
Further, I assert that we CAN and MUST expect the level of
service that we expect at "bigger" outfits when dealing with our 8-bit
vendors. When I go into a "mom-and-pop" clothing store, I expect the
same service I get at, say, Macy's. I usually get better. And if I
don't get acceptable service, I no longer patronize that establishment.
Giving good service costs nothing. It actually tends to yield
profits rather than losses. So, saying that a given company should be
excused from offering quality service is incorrect. No company should
be excused for giving poor service.
BEST Electronics and B&C Computervisions are simply outstanding
examples of giving good service. The owner of B&C acquired a product
I was willing to pay for, even tho he did not stock it, for example.
He went down the street and purchased it at a surplus computer store,
then sold it to me for a no-doubt hefty markup. And I sincerely thank
him for it. He saved me the trouble of searching for one in second-
hand stores and garage sales. It probably took him 15 minutes to
get this piece of equipment. His doing so made my day! I intend
to spend a lot of money on Atari 8-bit items in the future, as I have
in the past. Since B&C has given me reliable, excellent service, I

will spend a good portion of my money in that store.
The slip-up at CSS doesn't mean I will never spend another dime
there. Everyone makes mistakes. But, since my first experience with them
was a bad one, I will most likely use them as a last resort. If I can't
find it at B&C, BEST, TOAD, American Technavisions or on the 'net, THEN
I will go to CSS.

So, while I do applaud Bob Puff for investing his time and money
in the 8-bit market, I feel no obligation to support his efforts if they
do not meet with my expectations.

-Joe

Source record: 95561

I've read several messages back that someone has been using whopping 16-meg partitions on their SIO2PC setup.

I don't have SIO2PC up and running yet, but I am wondering HOW they did that. I have the 130XE emulator up and running on my PC...and since it is supposed to use the same disk images, presumably I can do the same thing here.

To tell you the truth, I don't have the foggiest how to even "create" a new virtual disk image file. The only way I've been able to "make more Atari disks" on my PC's hard drive is to (with MS-DOS) copy the virtual disk file to a new filename, then run the emulator and format the "new disk" blank with Atari DOS. How do I "create" a new disk, esp. those huge ones?

Also: Is it true that the emulator won't run SpartaDos? No way! The emulator is fun, but there's no beating the real thing...and SIO2PC. I'm still trying to figure out where to plug in my Atari Joysticks...and that MAC/65 cartridge..... :-)

>interesting... Just what did you mean in SIO2XL actually?
>
(My newsreader munched my earlier reply, so here goes...)

To transfer between two Ataris on the SIO Bus will need very little hardware; almost all software. By connecting four lines on the SIO (five if you count the ground) you can send and receive. Cross DATA IN and DATA OUT, then cross COMMAND and INTERRUPT. Voila. That's all the hardware work needed.

From the software end, you'd have to write a handler that interprets SIO commands (all explained in the Tech Ref Notes). By writing a handler, or maybe replacing the C: handler (for Computer, get it?) the two machines could swap data etc.

In fact, one commercial product was released that did just that. It was a custom cable and a cart. The slave computer simulated a disk drive.

I'm not sure, but I think it would be possible for both systems to have independent peripherals. The hook up would be something like this:

800xl--drive-CUSTOM CABLE--drive--800xl

Has anyone tried this? Does anyone have any software? Any comments?

Dave

I used to enjoy reading the reviews of the "enemy" computers.
David Ahl (editor) would always list a type-in of some program that
demonstrated graphics or benchmarking, or something. I used to get a
kick out of typin them up and translating them to Atari Basic on my 400,
then 800. I saved 'em on 410 cassettes. Heh. Those were the days.

Very astute point. The indicators and other oft-cited figures
are agregate quantifications that are only misused when related to specific
products or even industries.
If a given product or service's price rises at the rate of
inflation, saying that inflation caused the rise in price begs the
question.
Only when the various inputs' prices rise at the rate of inflation
is this true. But even then, one must look beyond that, to the most
basic level: the prices of raw materials and labor, as well as the
quantities of these used. (ie,if the price of labor increases 10%,
but a new process uses 50% less labor to produce one unit, there is
no justification for a rise in price implied.)

>These companies are taking a bath on the hardware and they want to make

I agree with your assumptions. Keep in mind I have no basis
for my belief, but what you say does sound reasonable.
Back in the beginning of the home videogame industry, there was
no data to give management an idea of what the life cycle of their
hardware products was. At the same time, as you note, software titles
generally had longer lives as profitable products. Today, neither of
these things is true.
Nintendo,Sega, and the other companies in the home videogame
industry have a much better idea of how long they can keep a given
product in the marketplace before they introduce it. Thus, they are
better able to ascertain their optimum price point.
Sadly, that leaves us, the consumers, with the ability to
buy fewer games.
The strange thing to me is the lack of price competition in the
videogame software market. It is as if the various manufacturers had
decided together on a few different pricing levels.

Just another reason to stick to the Atari 8-bit market, where
bargains abound. :)

-Joe

The operative rule (approximation) is the rule of 68 (or 67 or something
around there) which is that the number of years (approximately) for
prices to doubles is 68 divided by the inflation rate .. ie in 10
percent inflation times, prices double every 6 or 7 years, while
in 5 percent inflation times, prices double about every 14 years
or so.

<numerous examples deleted>

>

In contrast (given the season) to heating oil which has not gone
up as much as inflation, and for which I am grateful (having an
older relatively non-efficient home). If I recall correctly, when
I bought my first home in 1982 or so, I paid about 80 cents a
gallon for heating oil. Last season, except for that brief,
widely reported spurt to about $1.10, we averaged about 98 cents
or so.

Somethings go up more than inflation, some go up less.

What these two underlined paragraphs boil down to is just a
redistribution of the recouping of _overall_ development costs.

>
>They will price things as high as the market will bear rather than
>pricing lower to induce sales as they do with the hardware.

Or they price hardware at or below cost to gain market
penetration, as any cellular phone customer is happy to take
advantage of in buying a phone with a value of $600 or so for less
than $100 along with activation on the carrier associated with the
dealer/phone.

Now, to put actual numbers on things, here are the official
seasonally adjusted urban consumer CPI numbers since about 1950
for the month of January:

1947.01 21.5
1948.01 23.7
1949.01 24.0
1950.01 23.5
1951.01 25.4
1952.01 26.5
1953.01 26.6
1954.01 26.9
1955.01 26.8
1956.01 26.8
1957.01 27.7
1958.01 28.6
1959.01 29.0
1960.01 29.4
1961.01 29.8
1962.01 30.0
1963.01 30.4
1964.01 30.9

1965.01 31.3
1966.01 31.9
1967.01 32.9
1968.01 34.1
1969.01 35.7
1970.01 37.9
1971.01 39.9
1972.01 41.2
1973.01 42.7
1974.01 46.8
1975.01 52.3
1976.01 55.8
1977.01 58.7
1978.01 62.7
1979.01 68.5
1980.01 78.0
1981.01 87.2
1982.01 94.4
1983.01 97.9
1984.01 102.1
1985.01 105.7
1986.01 109.9
1987.01 111.5
1988.01 116.1
1989.01 121.4
1990.01 127.6
1991.01 134.9
1992.01 138.5
1993.01 142.9

From what I've heard on the news, last year was another 3.8
percent or so, or about another 5.5 points to something like 148.5
or so. Looking at the numbers, prices have doubled since about
1979-80, or in 15 years.

From: crow@coos.dartmouth.edu
Message-ID: <3fimg5$drc@dartvax.dartmouth.edu>
Source record: 95579

Back before Christmas, there was quite a bit of discussion about reading Atari formatted disks (single and enhanced density--double has been solved for some time) on a PC. I don't think we ever came to a complete conclusion, unfortunately. Here's what I think we figured out:

The program "Anadisk" claims to read almost any disk format, and will dump the contents into a raw disk file. For enhanced density disks, it correctly figures out the format, but generally fails to read entire sectors correctly. It usually gets the first "half" of each sector or so correct, but that's all. For single density disks, it either fails entirely, or succeeds perfectly, depending on the hardware that you're using. (I've never seen it work for me, so I'm not sure what hardware is required.)

From a technical standpoint, this is what we know:

Atari formatted disks encode the data with all the bits inverted, so a raw dump of the disk will require a bit flipping program to make it usable.

Enhanced density disks are technically double density in that they use MFM encoding, whereas single density uses FM encoding. Most(?) PC's aren't capable of reading FM formatted disks, due to hardware constraints (is it the controller card or the drive???).

If you use both sides of your disks by flipping them over to use the back side on the Atari, you won't be able to read the back side unless you punch another timing hole in the jacket, as PC drives use the timing hole.

So the main questions that remain are:
* What do you need to get your PC to read FM disks?
* How do we overcome the problems reading enhanced density disks?

--PC

P.S. Anadisk is available from:
ftp://ftp.cs.dartmouth.edu/pub/crow/anad207.zip

I don't feel it necessary to trash Puff, but I think anybody that has had any contact with him at all finds him a little off center. He craps on anybody who does anything other then what he considers "The right way" & I've found his critisism of me in the past to be unfounded. We he found out he was wrong or instead of just saying "OK, you won't burn up a computer with that" to retract his original statements he threw in a couple of other snide remarks. It's my opinion that he has used his cult status to lead the attack against Sparta DOS. When he found a bug in the xf551 OS his only response was to sell an upgrade ROM. I don't want to invoke an Atari Demi God here without his permission, but he's been called a "Rip off Artist" by at least one person with a lot more contributions to the Atari community for 1) Selling the Archiver which has the rep of just being a Happy rip off. 2) Helping to dry up the commercial software market by selling this an other cracking devices.
For those foreign readers, everything I've listed here is considered hard nosed business in the US. Bob has done nothing illegal, but he does play the game HARD!
He hasn't relied solely on his rip off products to survive, but I seriously doubt if you would find a SINGLE commercial software producer that he would have a good reputation with. Now if a person has a bad reputation with software producers for helping to ruin their market by enabling people to distribute illegal copies of there software, can't you call him shady? The definition is just "of questionable merit". When you consider the product line he sells compare to other vendors like ICD or Newell I think people, particularly former software developers, have a right to be P.O.ed. Christ! I expect people to warn me I'm crossing the line by revealing too much info on how to hack carts! I'm suprised no one hasn't yet. Why should Puff be immune from critisism?
Well, I got a load off. Sorry if I offended, it was just meant to be a reality check.
Rick

343. Connecting 2 Ataris

Source record: 95584

Recently somebody posed the question of connecting 2 8-bits via the SIO leads. This is partially possible but it requires one or two modifications and doesn't work 100% of the time;

Firstly each machine has only one SIO port, so if you want to use an SIO peripheral (eg a disk drive) with your computers you are in a bit of trouble. The answer is to 'piggy-back' another SIO socket on top of your original socket in one of the machines and hard-wire them together with shorts lengths of plastic coated wire. You can now have both computers linked together and a further daisy chain of peripherals! However this raises another problem, it doesn't work!! However all that is needed to fix it and make it work is to disconnect the 5v line on the SIO lead that goes between the two computers (I've forgotten its number off hand) and hey presto either computer can use the disk drive, although obviously not both computers at once! There you have it a limited interconnecting device, with the right software it SHOULD be possible to get the two machines talking too each other!
Unfortunately all is not well, for some reason drive 2 doesn't respond to either of the computers. I can offer no explanation for it!

This dampened my enthusiasm and I never got around to trying the printers or tape decks, and due to lack of desk space I have moved one of the computers out of standard SIO range. However I hope I have got one or two people thinking and I would love to hear from anybody else who has done similar things and hear what their results have been.

Source record: 95587

An excellent (yet graphically-challeneged :)) Mah-jongg game for the Atari is MyJong. I forget who it's by, but it's controlled with a mouse-style pointer with a joystick (might support other input, I forget) and is in Graphics 7 (160x96x4colors) mode.

Besides the fact that the graphics suck, it is an EXCELLENT game; it has different types of cheat modes, the ability to look at the game from a different angle, the ability to change the size and number of tile-types for the pile, etc.

It DOESn't position tiles unevenly though (like this:

22
112233
114433
44 only like this: 22
22
114433
114433)

Anyway.. I highly recommend it. I played it for HOURS. I'm still thinking of making a new one. Perhaps if I can get a FlickerShade mode going with it I'll be happy.. (I guess lately I'm thinking to myself "Yeah, DLI's are GREAT, but they're not PRACTICAL!" :) I fell in love with APAC and ColrView I guess! :))

James Wood <jamesw@CSOS.ORST.EDU> writes:

>I've read several messages back that someone has been using whopping
>16-meg partitions on their SIO2PC setup.

I've been using an 8 meg partition without any problems. If your DOS
will support it, then SIO2PC will happily provide it.

>To tell you the truth, I don't have the foggiest how to even "create" a
>new virtual disk image file. The only way I've been able to "make more
>Atari disks" on my PC's hard drive is to (with MS-DOS) copy the virtual
>disk file to a new filename, then run the emulator and format the "new
>disk" blank with Atari DOS. How do I "create" a new disk, esp. those
>huge ones?

I use SIO2PC to create partitions. You don't need the cable to do
this, just the program on your PC--it's really straightforward. I
don't know if anyone else has written a separate program to create
virtual SIO2PC disk files, but there's no real need to, that I can
see.

UPDATE to Long list, mags, books, software, games, hardware.

Here is what is left (if I haven't made any typos!). I get a lot of mail so the first offer will probably get it, but I will TRY to answer everyone as soon as possible.

Atari Books

Games for the Atari (S. Roberts, paperback 115 pgs.)

Atari Basic, Faster & Better (Carl Evans, paper back, 290 pgs.)

Atari Basic (Richard Haskell, paper back, 170 pgs.)

Compute!'s First Book of Atari Graphics (spiral, 248 pgs)

Proto's Graphics Machine (Geoff Caras, Pamphlet, 25 pgs)

Learn to Program Fancy Fonts (Rich Wilson, pamphlet, 68 pgs)

IBM-PC (Wilson, pamphlet, 45 pgs spiral)

Atari Dos 3 (pamphlet, 30 pgs)

Atari Dos 3 Reference Manual (spiral, 98 pgs)

Atari Disk Operating System II Reference (pamphlet, 98 pgs)

Atari ST User's handbook (Gilbert Held, paper back, 167 pgs)

Software

Atari-writer CART w/docs

APX spelling checker disk for Atari-writer w/docs

APX Calculus Demon (Disk w/manuel, APX software) {doesn't anyone do symbolic calc anymore?}

Music Composer Cart & Manuel (Atari, w/manuel)

B-graph (Batteries Included, disk w/manuel) {Probably the BEST plotting/curve fitting software ever made for Atari}

Atari Home Filing Manager (disk w/manual)

Alpha Systems BASIC Turbocharger (disk w/docs)

Alpha Diskpack 1000 (disk)

Alpha Advanced Protection Techniques Disk Utils (disk)

Santa Cruz Graphics Machine (no docs)

MMG BASIC Compiler (no docs)

Monkey Wrench II XL (same as Monkey Wrench II but for XL only, not left cart, no docs)

Font Editor (Irata Verlag)

Super Label II (Irata Verlag, no docs)

Allen Macroware Diskwiz II (no docs!)

Programmer's Workshop Stat. Pack. (no docs!)

PRINT SHOP STUFF (Disks w/docs); {how about $1 each for these, or $10 for all 12?}

Graphics Disks for above, #1, #2, #3

Gag Disks for Print Shop, #130, #224, #233, #225, #226 (Icons)

No Frills Software Fonts & Borders for Print Shop

Genesee Atari Group Icons for Print Shop

Genesee Atari Group Cute Labels

Sourcer's Apprentice (Magic Atari Disk)

XLENT Software (Disks w/docs); {Really very good for fancy hard-copy and to view 80 col. on screen!}

Rubber Stamp

Typesetter

Page Designer

Mega-Fonts II

Mega-Filer

GAMES

Chess Master 2000 disk for Atari w/manuel

Ace of Aces (Acclocade, disc w/manuel)

Mig Alley Ace (Microprose, disc w/manuel)

225B Baker Street (Datasoft, disc + notebooks) {One or multi-player Sherlock Holmes}

Eastern Front Cart, Atari, (no docs.)

HARDWARE:

Atari 1010 Program Recorder (Newer Style)

Star Gemini 10" Printer

Protecto Big Blue silent 9", 80 col. thermal printer w/Atari interface & docs.

Atari 810 Disk drive w/power supply

Atari 1050 Disk drive w/power supply

2 good working Atari 800XL computers w/power supply

2 good Atari 800 computers, working (1 CITA, 1 GITA) w/power supply,
$20 ea w/16k, or $25 w/32k, or $30 ea w/48k

I got the books some time ago from a friend who was getting out of Atari; they were not mine originally, but I hate to see them go to waste. I am continuing to go through the stuff and eventually plan to post to the Atari 8-bit group.

All of this Puff bashing is disconcerting. Bob Puff has been nothing but businesslike and gentlemanly with me.

Bought a 3 slave mux a while back from a guy in Florida. Needless to say, about a month later, one of the slave cards blew up and starting smoking (no joke). Contacted Bob Puff, and for the cost of SHIPPING, he agreed to send me a FREE replacement. Subsequently, he has done this 3 more times -- without charging me for a new mux slave card.

In addition, he has been more than helpful in taking my phone calls and answering mundane questions regarding Bobterm, SuperArc, the R:P interface and virtually any other Atari 8bit oriented question.

It goes without question that Bob Puff is no egomaniac, but a nice person!

I recently brought my old faithfull 8_bit Atari 800 XL down from the loft. It had been up there sometime so had gone through quite a lot of climatic changes. I was really looking forward to booting up some of the old favorites until I switched it on that is. The XL immediately went into its internal check routine. The ROM appeared to be fine but when checking the RAM only 4 of the squares appear green, the rest are red. It then continues to repeat the check over and over again.

Can anyone tell me what the problem might be and how it maybe fixed?

Please E-Mail me at my address below.

James, snail mail may not be the best way to get in touch with Bob Puff.

It's not easy having to ship things across north america to Puff, so I sympathize. However, if you only decided to chalk up the long distance and CALLED him, 99% of the time he is available for chatting during eastern standard time business hours.

By the way, probably the #1 problem in setting up things like the the BB/FB is cabling errors. Reversed cables can FRY components on the board such that even if you fix it, it will not work right. This happened to me when I plugged in the modem port reversed.

The SCSI port can handle being reversed, but the serial port can't and the parallel port is probably also fragile.

Since the BB doesn't output standard ports, it pays to order cables directly from Bob and not risk screwing up building your own.

I had flakies with my Floppy Board a while back and it turned out that ONE PIN was missing on one of my 3.5" drives. I had to go in there and solder a TINY jumper wire from the motherboard on the 3.5 to the conversion board (pin to edge card). After that my flakies went away.

TERMINATION and IDs are also a big source of problems. Luckily most newer floppies automatically passthrough or terminate. I didn't have to go searching for termination jumpers/chips on my floppies even though on the 2 360K drives I have, they looked old enough to not be automatic.

ye gods! The man must be a saint to have so many rabid supporters!

As I remember (and I may be wrong), only ONE person had anything negative to say about Bob Puff as a *person*. In addition to that, *I* only said that his business wasn't up to my standards based on my own experience...I didn't say anything about the guy personally! Yeesh! You'd think I'd knocked the Pope to a bunch of Nuns!

The whole point of the argument has been completely lost in this 'Bob is Wonderful' sub-thread. The argument was, whether Atari 8-bit vendors should be given a 'bye' on quality control just because we are a relatively small market for them. I said no, they shouldn't, and used the CSS experience I had, and my reaction to it, as an example of what I think should be done to any company that does not meet customer expectations.

I'll remember to be careful what I say about Bob Puff and his company in the future. :)

-Joe

Ok, So here I go adding in my anecdotal defense of Bob Puff and CSS...

I have had nothing but extremely good service from Bob and CSS.

He has ALWAYS been courteous on the phone with me and has been more than generous with his time and talent. Is he an 8-bit guru? Yes! Is he a god? NO!

When I ran into a problem with the Black Box trying to format the latest version 105MB Syquest removable, he offered to send a fix for free. (It turned out that this Syquest was using a different formatting flag sequence in the timing, and I am now running with an 88MB removable with no problems).

It is true, that one must be careful setting up the Black Box. Ports can be fried or damaged. I strongly urge using his cables and following the instructions very carefully and calling him directly when you are not sure.

The hardware handshaking is great. I routinely operate at 9600 baud plus with the Black Box without losing characters when running Bobterm or FlickerTerm 80 or the like. (Of course I can't go much faster than 19.2 and, yes, I have patiently waited for the R:P interface too, rumored to go to 38,400 taking full advantage of a 9600 baud with V.42bis data compression).

The fact remains.... His hardware is functionally very good. It may not be the greatest to look it at, and it is NOT perfect, but it works, and quite well.

It sounds like a couple of you have had negative experiences that are NOT the norm when dealing with CSS. I can only speak to my very positive experiences with Bob Puff and CSS.

I am NOT denying or taking issue with those who have had less than stellar service and support from CSS and Bob Puff.

I am only providing anecdotal evidence to the contrary...

A "Happy Drive" is a hardware modification/chip/board added to either
an 810 or 1050 disk drive which allows it to read faster with the normal
SIO commands ($E459), read/write at "Warp" speed via special SIO
commands and copy certain disk-based copy protection schemes. The last
point is the reason most people purchased them, although the first alone
was probably worth it. Happy Computers Inc. (founded by Richard Adams
-- brother of Scott Adams Adventure International) was located in the
San Jose area. Up until v5.2 of the Happy Backup Program (the program
that the enhancement used to copy disks), one was able to copy a disk
and run it on a non-Happy drive. After v5.2, certain copy protection
schemes were introduced (e.g., those by EOA, Synapse, et. al.) that the
modification was unable to duplicate. The way this was gotten around
was by writing some special programming instructions on track 0 of the
copy which "fooled" the copy protection checks into thinking it was a
copy. An unfortunate side effect of this "fooling" is these copies
could not be run on non-happy drives. At that point, many owners got
extremely upset with the product and stopped supporting/purchasing it.
Fortunately, at this time, the "Deluxe Option Board" by Central Point
Software for the IBM personal computers came out which was able to
duplicate every piece of Atari disk-based copyprotection schemes that
came out, except for physically-modified disks (e.g., laser holes in the
disk). People didn't buy Happies as much anymore, but at that time,
the 8-bit was already losing support anyways. Happy did put out an
"enhancement" cartridge for the ST (Diamond?), but it was basically a piece
of junk from what I've heard. Happy soon went out of business. Happy was a
breakthrough product for the time and did what it was supposed to for 2 or
so years. I think you can still find them at places such as San Jose
Computers (if it's still up :^)).

Lates!

$.02, I think Bill told me he went though 3 jobs since OSS before he landed a job he felt was appropriate for his abilities. In what I'd estimate to be about a year later, he bid goodby to our user group & announced he had another job in the State of Washington. I think that made it something like 5 jobs in about 5 years. Not a good way to get famous or have a well known address/place of work. I don't know, a heart attack would be a little easier to believe since he's around 50 & built like the Stay Puff Marshmellow Man.

370. Re: SIO2Unix or DOS

Date: 1995-01-20 08:31:42 UTC
From: ipoorten@cs.vu.nl
Message-ID: <D2p3ow.LJ0@cs.vu.nl>
Source record: 95455

(Andrew H. comes up with the idea of having direct access to an MSDOS file-system via the SIO2PC cable)

I made such a program a while back for the Atari ST + ST/XL-Link cable. The XL could not boot from it yet, but read-file access worked fine. The program on the ST side simulated DOS 2.5 disks, but they were actually a lot larger then 130KB. While I was implementing this program I came upto several problems which I will mention here. Might be useful when somebody else wants to write a similar program for the PC...

First of all, the way I did it was, wenever the XL requested sector 361 (or 362 or 363 upto 368) I sended a sector which was build up to represent the directory of the MS-DOS file system at say drive A:\. Every entry had its own unique starting sector so after de directory was requested by the XL, I could make up which file had to be accessed by comparing the number of the next requested software and the starting sectors. Then the first 125 bytes of that file were sended with a link in the last 3 bytes to the _same_ sector. This way, files could be as large as I wanted. In fact, when I was testing my MODPlayer, I pushed in an 800KB 3.5" disk in the ST's drive and loaded the mods directly from that disk. But, the problem of this is that 'seeks' with note and point are impossible. Also, a write can be a bit of a problem too. I tried something with comparing the directory sectors with the newly written directory sectors to find out how to call the new file and having a VTOC with only one free sector everytime its read. Anyway, none of the approaches seemed to work. Things got messed up because when the directory sector was readed again by the XL, the newly written file appeared on another place (the place it was listed by the ST's DIR command) and with a different starting sector. I gave up because it wasn't that important for me at that time. I merely wanted to load mods directly from my ST-disks to save 5.25 disks and increase loading speed. (The ST/XL link is faster than my 1050) If any of you want it, I can put the GFA-Basic source on ftp.cs.vu.nl....

Greetings from rainy Amsterdam (Grrrr!!!)

Ivo

373. I can't read news / Anyone want to test HyperIt!?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-20 10:56:05 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9501201057.AA25680@zippy.sonoma.EDU>
Source record: 95461

One: for some reason I can't read news at the moment, and I don't know how long this will last, so excuse me if I don't reply to comments or questions here on c.s.a.8.

Two: is ANYone interested in HyperIt! The three people who I KNOW have looked at it already are Odaman, D.Paterson, and hopefully by now Bernard Kok. I've only really discussed it with Odaman who likes it and says he's going to take a crack at making some Stacks for it.

For those who don't know yet, HyperIt! is this:

A program which reads in and executes a listing of commands and gives the person running the program a mouse-style pointer to point at things with.

Commands include:
Loading an image
Loading a font
Placing text on the screen
Adding buttons

So far (much more is planned), when the user "clicks" a button, it'll either:
Quit
or Go to a different "card"

Cards are these command listings. Stacks are a set of cards (at least one), plus any support files required by the cards (graphics, fonts, text files, music files, sound files, etc.)

A few good uses of "Stacks" include:
Interactive documents (rather than have footnotes, the user can click words)
Interactive tutorials and tests
Point and click games (I see mainly Myst-style games, as Myst was more-or-less written in a HyperCard style environment (HyperCard is what HyperIt! is based on))
Point and click "worlds" (especially for children. Those familiar with "Living Books" will note that HyperIt! can probably make such things. Say there's a picture of a classroom. Click the apple and you see a worm crawl out or something.)

Future versions will include support for:
Sound (standard Atari sound)
Music (perhaps POKEY Player or AMP or SoundMonitor or all three?)
Digital sound (if I have enough RAM!)
Sub-linking (as in "GOSUB" versus "GOTO" in BASIC)

"Icon" support (either true PrintShop icons or simply less-than-full-screen
images; if the latter, a PrintShop Icon converter will probably be made)
Icon animation (good for animating only parts of the screen)
Variables (good for keeping track of where you've been or what selections
you've made. Radio and Check style buttons could be created with these.)
IF/THEN/ELSE/ENDIF blocks (which will give variables their usefulness.)
Stack editor

For now, stacks are created by simple making a directory, copying the
required support files into it, and creating cards (which again are just
text files containing a listing of commands).

A simple example CaRD follows:

```
; EXAMPLE.STK>EXAMPLE.CRD by Bill Kendrick 1/20/1995
MODE 8
CLS
TEXT 10 10 "Hello there!"
BUTTON 10 10 21 10 0 HT
NORMALBUTTON 10 12 "Goodbye!" GB
END
ON 1
LINK HELLO.CRD
ON 2
QUIT
; END OF CARD
```

*** Note: true card syntax is a little uglier, it uses RETURN's to denote
parameters, not spaces. "TEXT 10 10 "Hello there!"" would really be:

```
TEXT
10
10
Hello there!
```

But again, it's in its beta infancy! So if you're at all interested, please
contact me (kendrick@vax.sonoma.edu or kendrick@zippy.sonoma.edu) and I'll
send you a copy of Beta version 0.4. It is about 45K ARC'd, requires 48K
of RAM, runs under MyDOS 4.53, probably under 4.50, might work in SpartaDOS
(not tested yet) and definitely NOT under Atari DOS.

Comments, suggestions, and bug-reports would be GLADLY accepted!

Also, so would some home-made STacKs! :)

Thanks for listening!

I don't know about Unix, but the Amiga seems to have a very flexible way of treating file systems. You don't have to chose just one, you can have several active at one time.

Instead of simple MS-DOS converter programs like BBXFER on the Atari8 end, the Amiga actually absorbed the majority of the MS-DOS filesystem as an alternate filesystem which it can recognize, read and write to as if it were native. This is pretty transparent to the user, and I use this to transfer files back and forth to the Atari since I have the floppy board.

It would be nice if there were a CROSSATARI that told the Amiga how to read and write in MYDOS or SpartaDOS because that would be a lot more direct. There are even old 5.25" drives for the Amiga, but you have to go looking for them.

CROSSDOS works for both floppies and hard drives, although it takes some configuring to get it to do hard drives. If someone ever write a CROSSATARI, it would allow you to redirect a SIO2AMIGA cable to a physical partition. The filesystem would be genuine, and transparent to the user, you could then move files freely from side to side.

Too bad this hasn't been tried yet. It's got to be a lot easier than an MS-DOS hack.

Actually the way to interface an Atari to the Amiga would most likely be the floppy port, not the serial port. The stock serial port on the Amy is not its best feature.

Some of this has to have been addressed by Jim Drew when he worked on the Atari800 emulator, I would hope. Otherwise there would be no way to read protected boot-disks.

376. SpartaDos clock - it will be late in Germany

Newsgroup: comp.sys.atari.8bit

Hello !!!

Yesterday I made some little experimnts with SpartaDos.
I found that the clock is late all the time.
I guess that Sparta use the VBI to count the clock timers.
So my regard to FTe - there are some registers (f.e. in the GTIA) where you
can find out if the machine ist running in PAL or NTSC mode.
Please use these registers to initialize the clock !

Date: 1995-01-20 16:22:07 UTC
From: clf3678@ultb.isc.rit.edu
Message-ID: <1995Jan20.162207.7466@ultb.isc.rit.edu>
Source record: 95466

Hey all.

It was brought to my attention that there was a message thread concerning Bob Puff and CSS. As I am a former CSS employee, maybe I can help clarify some of the mystery surrounding CSS.

For reference, I worked for CSS from the time Bob took over the company (June 1991) through some time in 1993, when going to college and working 2 jobs was just too much.

For all intents and purposes, CSS is a one-man company. While Bob does have somebody to answer the phones on occasion, and while he does have somebody who builds the products for him (my old job), Bob does everything else: all repairs, sending out orders, product development, and product updates.

There's still enough business to keep him very busy, which is why new products aren't reaching market right now. He has a hard enough time handling orders, phone calls, and repairs. Only when business slows down (which is usually Jan-Mar) does he have any time to consider getting new products designed. Bob has also been doing some contracting work to generate extra capital for the company, which is most likely why his new products aren't out yet.

Also keep in mind that putting out a new product requires a capital investment. As you can guess, CSS is a low-profit business. The big product CSS developed while I was there was the Floppy Board. The investment in parts just to build the things was enormous, and the profit margin is very small on them, since the market wouldn't accept a "fair market value" for what the boards are worth. When we first released them, we doubted that the product would ever generate a profit. As long as we broke even, we were happy. At this point, I don't know how many have been sold.

As for Bob's personal character, he really doesn't deserve to be called "shady", or any of the unkind words spoken about him. While he does have his idiosyncracies (like everybody has), he's genuinely a nice guy who really loves Atari 8-bits. After all, if he was in it for the money, he would have ditched a long time ago.

I hope this answers some of the questions/problems some of you have had with CSS. If you have any more questions, feel free to ask.

A similar system exists for Linux.

["CrossAtari" idea deleted]

>Too bad this hasn't been tried yet. It's got to be a lot easier than an
>MS-DOS hack.

Not if you don't have an Amiga. :-)
(I realize a similar thing could be said about Atari-MSDOS and
Atari-Unix systems.)

I think it would be interesting to have a SIO2UNIX program or
Xformer-Linux. Since Unix treats devices and files the same way,
something could be rigged up so that when they look for the virtual
disk file, they'd find a real hardware device (such as an Atari disk
drive).
I guess this would be more useful for the emulator than for a
SIO2whatever. :-)

: be fried or damaged. I strongly urge using his cables and following the
: instructions very carefully and calling him directly when you are not
: sure.

What I find more or less odd about the whole thing is that more Atari 8-bit vendors and personalities aren't on the net... Heck, even in bass-ackwards Louisiana, a full-access shell account is $10/mo or $90/yr (in advance). I think that even the most strapped of those devotees hanging on for us and supporting the 8-bits could get an Inet account. I'm sure Bob Puff would like to know exactly what his customer's perceptions are so he could try to improve in those areas.

I think the Vendor FAQ shows the email addresses of those vendors with Inet accounts, but I don't recall it being that many (??)

I think, among other things, it would be a damned convenient way to receive (and even track) orders. Even little old Pine is better than a piece of paper...

Just some thoughts...

From: Peter@bell.demon.co.uk
Message-ID: <790639908snz@bell.demon.co.uk>
Source record: 95474

This is probably a strange question, or one better sent to another group,
but here goes anyway:

I'm trying to write a 400/800 emulator (this is redundant effort, but it
still seems like an interesting project), so far I've got the CPU emulation
and the display system working (and a kind-of-faked-up POKEY), but the timing
is all over the place (this is _really_ noticable with code that uses WSYNC),
which is probably due to the way that I'm not actually counting machine
cycles. A quick poke with a scope at some real (rather than virtual)
Ataris suggests that just trying to lock the CPU emulation to a fixed
speed isn't going to work, since the cycle timing is not stable due
to all the DMA that occurs.

There seem to be (on a real machine) at least 4 types of DMA going on:

1) Memory refresh
2) Display list
3) Display data
4) Player/Missile data

Do any of the Atari gurus out there know where I can find a source of
info about exactly when these occur. I would like to get this sorted
out before I try to implement the audio generation stuff in POKEY.

Well, at least it runs the OS and the assembler-editor cart :)

Thanks in advance

Pete

THe transparancy of CROSSDOS which you described sounds a lot like PCExchange on the Macintosh. FIrst, they came out with "Apple Filx Exchange." You had to load this first before you stuck your DOS disk into the drive, otherwise it'd say "Want me to format this or eject?". Then, you had to select which files you wanted to move from one place to the other (disk to disk/hard-drive). Now, with PCExchange running (it's a boot-up "extension"; sorta like a handler or TSR), you just pop a DOS disk in, and you can copy to and from it, run applications off of it, open documents off of it, save stuff to it, etc., just as if it were a Mac disk. VERY nice. :)
Can't do that on a PC (I think).. you have to run MacInDOS which is a bit like Apple File Exchange (or S2PC or AtarImage for the PC).

The three best are probably:

800XL <- I'd say this is the best
65XE <- same as 800XL but newer (and no PBI? I forget!)
130XE <- biggest RAM (128K), had ECI (sorta like PBI)

Reason I say 800XL is best vs. the two XE's is the keyboard. I've touched
a 130XE before.. I didn't like it! :)

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu Got a new .plan!
William (Bill) Kendrick / | \ ** New Breed Software **
I WOULD say 1200XL is THE best (Function Keys, great keyboard (big DELETE))
but the OS is funky so w/o upgrade it's flakey. 'Course, 800XL only has 64K
and I said it was the best... it can be upgraded to 4MB (as can XE's).. hmm

Mah Jong...

It is a single player game from

ChildsPlay SoftWare Services
6812 Hill Place
Crystal, MN 55427

The bottom of the screen has a text mode title bar entitled:

MAH JONG @1993 CHILDSPLAY SOFTWARE

There are 100 pairs of tiles placed on a pile reminiscent of the Shanghai
"Dragon" formation. The tiles are randomly placed on five progressively
tougher levels. There is a demonstration mode. The upper left has a FIND
button, the lower left corner has a NEW button, the upper right has a
HELP button, and the lower right has an END button.

It's a proprietary emulation engine. Actual original code is run in
emulation. It's just that unless you crack the CD, you'll never be able
to test it on anything but the packin games.

Graphics are not improved, although seeing it on a VGA monitor would be
considered an improvement over blurry RF.

Atari 1450XLD by far.

Even though the 130XE was the only one with banked RAM out of the factory, it was also the flimsiest with the worst keyboard feel.

If you can find a 1400 or 1450 where the PBI actually WORKS, that would be pimo. The PBI and the lack of a chroma line on the monitor port are the only 2 nits on the 1400 series, and only the 800 and the XE has an honest to goodness chroma line.

Glenn Saunders (krishna@primenet.com) wrote:
: Atari 1450XLD by far.

I would agree. But as for a full production run release for market over time the 800XL is probably the most prevalent. For techno-emotive reasons I would choose the classic 800 as the standard bearer. For elegance, looks, and "feel" the 1200XL does it for me! For actual functional use, I personally use the 130XE. Go figure!

: Even though the 130XE was the only one with banked RAM out of the
: factory, it was also the flimsiest with the worst keyboard feel.

I would venture to suggest that those 130XEs with the Mitsumi (56-3217), single-layer Mylar XE keyboard are not bad at all. I find the tactile feedback, though not up to 800 or 1200XL standards is really quite adequate. No where near the same mushiness as the Sugiyama (FKJ0201131) double-layer Mylar XE keyboard. At least I was pleasantly surprised!

I tried the XE Touch upgrade for the Sugiyama keyboard, but found it less than impressive. The keys felt too stiff for me.

I have to disagree with Glenn's comment on "seeing it in VGA is better than blury RF." Compare PC XFormer with a real Atari. When folks see stuff running on PC XF, they SEE how low resolution everything is, because the monitors allow far greater resolution, so they're much crisper. When they see it on a TV, some confuse 160x192x4 as being 320x200! (One friend even thought it was 256 colors! Hahah! :))

Also, the bluring helps in making shading looks a little nicer.

Of course, if they decided to shrink the display down to 320x200 or whatever but in a SUPER VGA mode (640x480 or more), that'd probably look nicer. :)

HI !

I just got my XFORMER 3.0 atari emulator. Well, I have to say
i am completely disappointed. Most of the games don't work at all and
those wich work don't work properly. Where is the sound ? I don't
wonna play Boulder Dash w/o sound ? And don't tell me that i forgot
to insert /s switch to command line or i don't have SB (I DO HAVE SB).
Another thing about BOulder Dash is DIAMONDS. They supposed to be scrolling
up (actually i mean a shape (texture) on'em) but it scrolls up only
if you go somwhere. If you just staying diamond are not scrolling.
What i am trying to say that PC XFORMER is unfinished and i want my money
back. Look at C64S emulator of Commodore 64. It is almost perfect. 98%
of games work on'em. PC XFORMR IS A SHAME !!!!!!!

RF, dude. You know how bad RF can be, especially when you have a lot of
electronic gear producing interference nearby like me. I can't even play
my 2600 these days because the interference caused by my rig just wipes
out the signal. I agree that some blurriness helps with dithered colors
and antialiasing edges, although enhancing artifacts in Gr.8 which is bad.

Okay. I'm trying to get my Atari stuff to my IBM PC. I've read the FAQ & I've gotten MyUtil & ATARIO. They work fine for reading the A-side, but I can't read the B-side of any of my disks. Help!

Also, I don't think these programs read single-density (90K) disks. (I can't remember--it's been _several_ months since I last tried.) If not, is there any way of doing this?

Info: Disks were written in single- (90K) or double-density (180K) by an Indus GT drive. I had to manually punch holes on the left side of the floppies to be able to write to the B-side. Can't use my Indus drive at all anymore, BTW.

Thanks in advance.

> - dcljr

Oh, shit! _Now_ I read this... this basically answers (& re-asks) my questions!

[pardon the reposting--this was originally posted by crow@coos.dartmouth.edu (Preston F. Crow)]

The program "Anadisk" claims to read almost any disk format, and will dump the contents into a raw disk file. For enhanced density disks, it correctly figures out the format, but generally fails to read entire sectors correctly. It usually gets the first "half" of each sector or so correct, but that's all. For single density disks, it either fails entirely, or succeeds perfectly, depending on the hardware that you're using. (I've never seen it work for me, so I'm not sure what hardware is required.)

From a technical standpoint, this is what we know:

Atari formatted disks encode the data with all the bits inverted, so a raw dump of the disk will require a bit flipping program to make it usable.

Enhanced density disks are technically double density in that they use MFM encoding, whereas single density uses FM encoding. Most(?) PC's aren't capable of reading FM formatted disks, due to hardware constraints (is it the controller card or the drive???).

If you use both sides of your disks by flipping them over to use the back side on the Atari, you won't be able to read the back side unless

you punch another timing hole in the jacket, as PC drives use the
timing hole.

So the main questions that remain are:
* What do you need to get your PC to read FM disks?
* How do we overcome the problems reading enhanced density disks?

--PC

P.S. Anadisk is available from:

I believe the Trak slave port was for Trak drives only. They had a number of
different models; the letters at the end of the model name indicated density
and sides. The printer port is an honest to goodness parallel port, with
intelligence to monitor the SIO line and send all P: stuff there. I'll look
at some old Analongs and Antics, and see what I can find for you.

Dave

414. New Atari Classics Second Issue

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-21 06:57:35 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2F1D56A3@POST0.LAAFB.AF.MIL>
Source record: 95498

Surprisingly, there hasn't been much talk about the much delayed second issue of New Atari Classics.

On Sunday (15 Jan), Mike Hohman called me and said that Jim Hood (the publisher) had heart problems and went in for surgery, came home for a day and then went right back to the hospital. That's the principle reason why the issue is delayed.

I called Bob Woolley last night (17 Jan) and chatted with his wife and she pretty much confirmed the story. She said they hadn't spoken to the Hood family for five days or so and had no further information. Bob was at a friend's house. I will call Bob Woolley tonight and see what he knows. I'd call Jim, but am a little "gun-shy" since he's been so ill.

Anybody know anything else?

Most C=64 games don't do things like display list tricks either.

When it comes to 8bit machines, the Atari8 is #1 on the hard to emulate
scale. C=64 and TI, because they both have hardware sprites and are
still rather complex, would come next. Things like the CoCo and Apple
II are easier, and simple stuff like CP/M is the easiest.

Perhaps Hello loads to high in memory with those loaded.

>There is another problem here also. When I have run Hello my BBS stop to look
>at D1: after Waitcall.cmd when the board is running. Its look thrue D8: in
>about 2 minuties before it looks in D1: there the BBS will look after a Command
>file if it doesnt find the right CMD file directly. In other words HELLO.COM
>does something whith the memory when it runs.

You can change the load address generated for HELLO.COM by a command line
option, I believe -Ohexadr. The programs generated will generate a stack from memtop
working down in memory. If something is loaded in high memory it may be overwritten.

>There is also somethin about memory in LINK65.DOC and I try the default one
>ther when run the final compiling of the OBJ and OLB files. and nothing
>worked.!! CB-)

I don't remember the default, but I believe it is $2000 (8192). After booting up and
loading
the files, check memlo to see what it is (I believe the command is MEMLO but I don't
usually use Spartados. I also have had files linked by link65 that would not work and
reordering the files made it work. Try my LINK65 compatable linker that should be on the
archive (KLINK). I also have an assembler that can assemble files compatable with RA65
called KASM.

Of course this could be done with indirect addressing making very hard to find
unless you were able to trace it.

>Now, if I have a good image, and load it into Xformer,
>I'd believe that Xformer changes that address to ROM, cracking
>the copy protection. This is how I've seen some esoteric hardware
>cracking done.

Will Xformer 3.0 support a 16K rom image. 2.5 loads a BASIC rom image but
substituting a 16384 byte file for BASIC.ROM won't work. How about a way to
specify ROMs on the command line, and switch them from within the program.
I am loosing access to the IBM compatable so I won't be able to play with XFormer
for a while or order 3.0.

>My question is: I transfer the ROM image to my SIO2PC disk,
>and load the disk containing it in the emulator. How do I transfer
>the ROM image OUT of my Atari disk image into the DOS filesystem?
>That's the only way PC Xformer would do it.
Tranfer the ROM image as a file to a file on the PC if you have a way to connect the
two other than SIO2PC. If SIO2PC is the only way to transfer files, then a program
would be needed on the PC end to extract it, if one exists.

>Also: What seems to be the problem with copying bank switched
>cartridges? I've talked to my father, and he thinks that if you get
>an image of the bankswitched cart, before it loads, Xformer would
>handle it. Something to think on. Will this work? :)
You could write a program to copy bank switched cartridges to a disk file. write all
the banks in a specific order, but PC XFormer would have to be made to support it.
OSS Super Carts (and others) uses addresses in the $D5xx range to enable and
disable the cartridge as well as selecting a 4K bank for the $A000 to $AFFF range with
$B000 to BFFF remaining constant.
Atari XE gamesystem super cartridges bank the $8000 to $9FFF range by writing to
a specific memory cartridge with the $A000 to $CFFF remaining static (if I remember

correctly.) I don't remember the location off hand.

> Thanks,
> Wes Brown

Rather than jamming a cartridge into the slot perhaps adding a switch in the S4 and S5 lines. You could put the cartridge in with the switch off. Lower ramtop, reopen E: then flick the switch. Would this work? S4 and S5 are lines that enable the ROMS within the cartridge. You may not even have to lower ramtop since the computer should think a cartridge is present

Labels S4 and S5 are from Mapping the Atari, Revised Edition page 234. Remember the diagram is looking into the back of an XE so turn it upside down when looking at an XL.

cp576@cleveland.freenet.edu

418. RVerter Type Interface (Instructions)

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-21 09:21:28 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3fqjmo$7sr@usenet.INS.CWRU.Edu>
Source record: 95356

How to build a serial interface (up to 19200 baud).

The following is the description of how to build an RVerter compat
interface. I have never actually seen one so I derived most
of this from tracing the connections inside an SX212 modem to
determine what pins on the SIO interface corresponds to which
on the RS232 connection(except the data lines which are obvious).
This interface should work with any RVERTER(or BOBVERTER)handler.
It may work with SX212 handlers or software but may not support
all of the baud rates. Handlers are available alone and with
some terminal programs like Bobterm.
I am not sure if all handlers support 19200 baud, but I have
used my interface connected via a null modem cable to an IBM to
transfer files at 19200 baud and have had no problems. I tried
38400 baud (by patching the handler) and too many errors were
generated. I also connected by SX212 to the interface instead
of the SIO connection and had no problems. I actually built this
by lightly super gluing the two ICS into a large DB9 hood and
soldered the connections. I don't recommend this approach unless
you are totally nuts. I would NEVER try that again even though
it did work (after fixing a couple mistakes). I planned on
eventually filling it with EPOXY but I didn't and pray nothing
ever comes loose. The cable I build has an SIO cable (from my
fried XM301 modem, and the interface build in the other end with
a DB9 male connector. I was able to use a ready made IBM cable
to connect to the modem. I also build a null modem cable and
gender changer. This interface is unable to communicate at the
same time as other I/O is occurring. This is typical unless
you have an interface that connects to the XL/XE parallel bus.
Note: CTS is not supported so you cannot use RTS/CTS handshaking.
Only XON/XOFF could be used. When transfering files between
computers, if you use a protocol this will not cause a problem.
No reponsibility is assumed for any damages resulting from
the building or using of this interface.

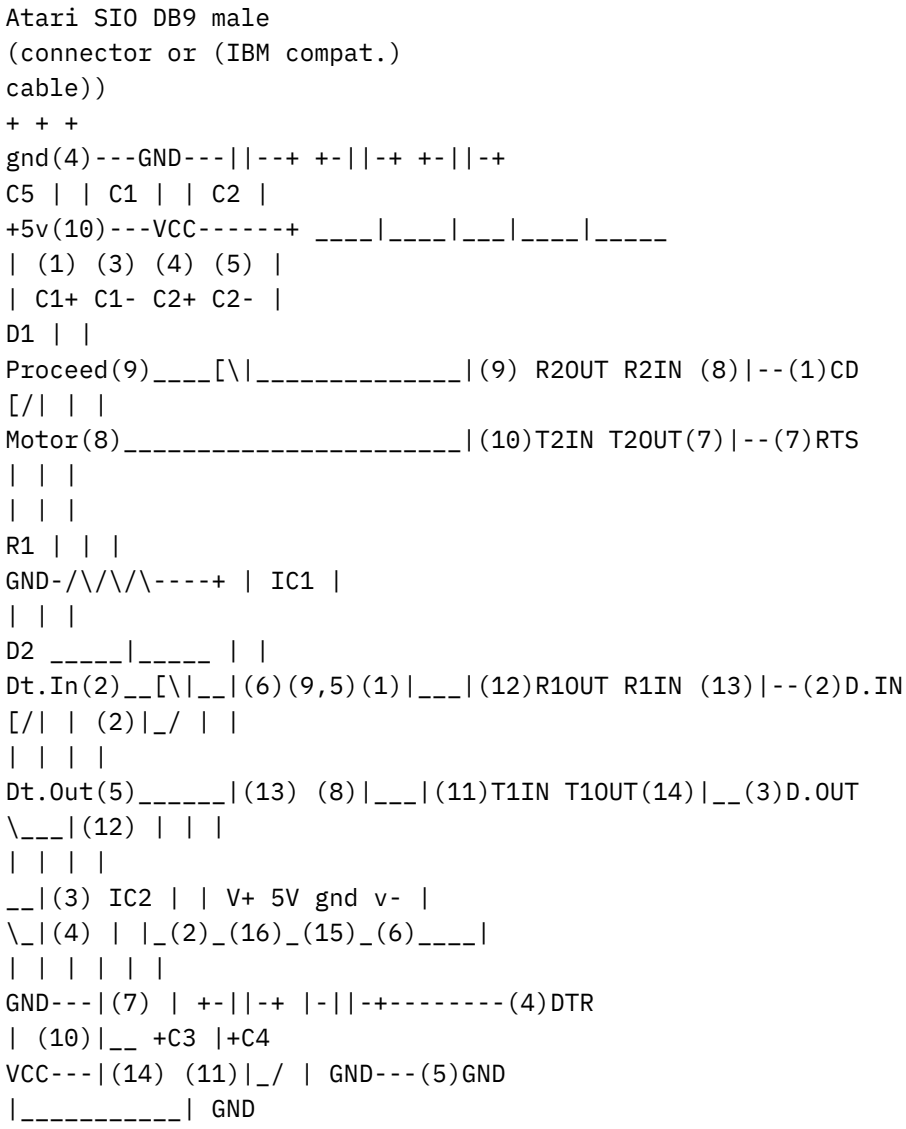
Parts:

IC1 MAX232/ICL232 RS232 Level Converter with onboard
+10V/-10V voltage generator.
IC2 74LS00 Quad NAND Gate. Used to disconnect Data Lines
when DTR is not asserted.
R1 1K resistor 1/4W
R2 4K resistor 1/4W (3K to 7K should be OK)
C1,C2 4.7uF capacitor
C3,C4,C5 10uF capacitor

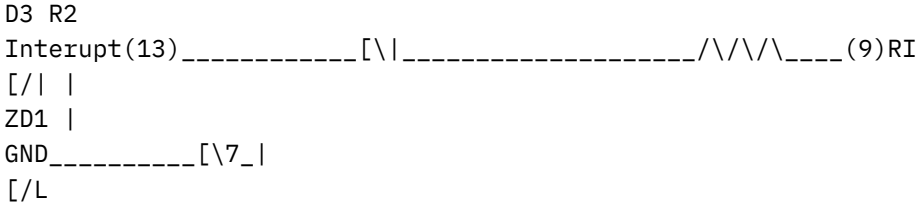
D1,D2,D3 IN4148 or IN914A or similiar diodes
ZD1 IN4733 5.1V Zener Diode or IN4734 5.6V Zener Diode

I don't have a data sheet for MAX232 and are giving the values for the capacitors from another circuit. I used 33uF caps for all of them (I have a lot of them I got cheap) and have had no problems. Place them as close to IC1 as possible. They should probably be 12 to 16 volt types or better especially C3 and C4 which see around 10 volts, where the other three only see 5V.

ASCII Circuit Diagram



Optional (Only needed to be able to detect ring signal from Modem): This is not tested, Hopefully it does not need to be inverted. You could probably use a 1489 if you know how.



Be sure to note polarity of capacitors. Note: The positive lead of C4 does go to ground since the other leg will be a negative voltage. + and / \ are use to show connections and bring connections together on the diagram. Sorry not to break the ICs down into parts but that would have made the diagram worse.

Pins for RS232 are for a 9 pin connector. With this connector you can connect a standard 9 to 25 pin cable to this connector to use a modem, or a null modem cable to transfer files. You can substitute a 25 pin connector using table below. If you plan on only using it for file transfers you can wire in the null modem cable before the jack. Note: The 9 pin connections are not the same as the 850 interface but are the same as used sometimes on IBM type computers. Change the gender of the plug as desired.

9 Pin	25 Pin
1	8
2	3
3	2
4	20
5	7
6	6
7	4
8	5
9	22

RS232 Definitions:

CD=Carrier Detect (inp) DTR=Data Terminal Ready (out)
D.IN=Data In(inp) D.OUT=Data Out (out)
DSR=Data Set Ready (inp) CTS=Clear to Send(inp)
RI=Ring Indicator (inp)

Null Modem connections

This is for 9 pin connectors, if a 25 pin connector is used use chart earlier to convert.
Connect pin 5 straight through.
cross in one end of the cable 2 with 3 and 7 with 8.
connect 1,4, and 6 in each end of the cable.

If you are only using the interface for computer to computer transfers, you can build this into the interface if you are careful. Connect what would go to pin 3 to pin 2. Connect what would go to pin 3 to pin 2. Connect what would go to pin 8 to pin 7. Connect 1,4,6 together on the connector. Connect what would go to pins 1 and 4 together. Connect pin 5 normally.

Parts Sources

Resistors, capacitors, diodes should be available from Radio Shack (not sure about the zener diode if you need it). The DB9/DB25 connectors and hoods should also be available there. Atari SIO cables are available from one of the Atari Dealers - just remove one end. You may also want to pick up a prototyping board at Radio shack to build it on.
I got the MAX232 for $1.65 and 74LS00 for 22 cents at BG Micro. (US$ only,$10 minimum order on credit cards) $3.25 minimum shipping ($7.50 Canada, $15 others, no shipping to Mexico or Puerto Rico). You could also get IN4148 diodes at 100/2.50. Other items that you could get to pad an order if you need them:
14 pin socket 13/1.00 (only need 1),16 pin sockes 13/1.00 (only need 1), 6821 PIA $2.00 (same as 6520?), 6810 (used in 1050) $1.25, 2793 (Controller used in 1050) $7.50, 4164-150ns RAMS at $0.49 or 9/3.50, 41256-150ns RAMs at $1.25 or 9/9.95 (256Kx1), 62256 32x8 SRAM $5.00 (can this upgrade the Black Box as described in the last issue of the original A.C.?) Orders 1-800-276-2206, Tech suport 214-271-9834, Fax 214-271-2462. P.O. Box 280298 Dallas, TX 75228. This along with a couple other places was listed in one of the original A.C. issues.

419. Re: XFORMER 3.0

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-21 09:34:24 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3fqkf1$86g@usenet.INS.CWRU.Edu>
Source record: 95357

PC XFormer 2.0 and 2.5 always had problems with DLI's executing
too soon except Gr.8 and 15 type Bitmap modes which are only one
scan line tall.

Character set information is not updated unless CHBASE address is
updated, a player or missile appears on the line, you update
something on the line. Programs that redefine characters for
animation don't update the entire screen unless it has too.
You can press page-up or page-down to forcibly update the screen

XFormer 2.5 has a problem with BASIC, It seems to treat it as
a cartridge if you boot with BASIC. Pressing SHIFT-F10 will
reboot without a cartridge. If you then press RESET BASIC gets
reenabled since TRIG3 isn't updated to the status of the cartridge
(How an XL/XE determines if the cartridge is present). I think
BASIC can also be enabled with 54017 location where it is not
treated as a cartridge.

If you have Neptune's Daughter, load it up on XFormer 2.5 and it
will completely bomb the system. Running under windows gives a
bad instructions or system integretety violation error, and suggests
you shut down and reboot. Under DOS, it just locks up. This is the
only program that caused such a violent error. It doesn't do this
on 2.0.

What kind of joysticks does 3.0 support. Atari Type interfaced some
how (I hope) or PC joysticks?

cp576@cleveland.freenet.edu

The DLI problem could cause a lot of other problems. Simple programs
like Analog's Elevator Repairman don't work. Others like unprotected
copies of Donkey Kong (except for minor problem of no collision detection),
Joust, Pengo work without a hitch (all bitmap games, HMM). Even some
sophisticated software works OK. I have seen some some games where
players don't quite line up, or color problems but this could be to
the DLI bug

cp576@cleveland.freenet.edu

I am loosing access to the IBM compatable so I'll have to put off
ordering 3.0 anyways :(.

420. Pictures from upcoming Atari 8-bit game posted to .pictures.misc.

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-21 09:51:26 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3fqleu$1hp@nic-nac.CSU.net>
Source record: 95358

Well, I had fun yesterday. I played with "Infini-D" on my brother's PowerMac 7100/66. I designed a simple (I may scrap it and go for a more complex design) space station for the introduction (and probably other parts) of my new, LARGE game "Geneocide" for the Atari.

This game will hopefully include:
Lots of digitized pictures and animation
Lots of rendered and drawn pictures and animation
At least some digitized sound
Maybe some digitized music (doubt it, actually)
IRGAAPMTFC graphics (IRG, Almost Any Point More Than Four Colors)
PFP graphics (Page Flipped Players)
Support for Hard Drive and RAM disk users
Support for MyDOS or SpartaDOS
Scaled-down support for folks who don't want all of the animation/sound or don't have room for it or don't have fast enough drives for it

More medium-to-high quality GIFs or JPGs (probably GIFs.. if not, maybe TIFFs because I'm not a lover of JPG's lossiness) may be posted, depending on how much art or rendering is done on a better platform.

Folks to thank for making this project happen in the first place include:
Jeff Potter for JViewXL
Nick Kennedy for SIO2PC
Rick Cortese for my SIO2PC cable
Bob Woolley for my 800XL'd 256K 1200XL motherboard
Bob Woolley again for Action!
& Russ Gilbert for saving my life with the CHAIN.ACT routine (now at UMich,BTW)

Hopefully I'll suck other folks into this project (other than my friend Mike for his video camera, my brother for his PowerMac, and whatever friends I round up for some of the animated acting that'll be included).

Any really good game or demo coders out there!? Although much better than anything else I've done before, my current introduction is a little "blah" (and musicless...).

For those of you interested in the PLOT of the game.. well... you'll have to wait and see. (Maybe not until I release the game, but I'll probably spill at least a few beans about it in the middle.)

>

It would be the controller ... the original floppy controller chip
seemd to leave out FM mode altogether, although later versions of
the controller added it, and I certainly have seen specific
references in AT&T motherboard documentation about being able to
read FM mode disks.

The problem boils down to standards ... the IBM PC took over so
quickly, and it did not use anything but MFM. The only effective
reason people would have had for adding FM capability would have
been to be able to read 8 inch FM disks on a PC (or single density
CP/M 5 inch disks). The PC compatibles never had it available
from the start.

<more deletions>
>
>So the main questions that remain are:
> * What do you need to get your PC to read FM disks?
> * How do we overcome the problems reading enhanced density disks?
>

I am coming to the conclusion that the solution to both problems
is the same, from reading between the lines of what has been
posted here. I think the controller chips which can handle FM (ie
-- a new capability) also have the capability of handling 128 byte
sectors more cleanly (another new capability).

>ftp://ftp.cs.dartmouth.edu/pub/crow/anad207.zip

If no one else gets around to it, and presuming I start clearing
my backlog of hardware projects, I will get this and play games
with it ... I have a wide variety of PC compatible hardware
around, including two controllers which are not just capable of
handling 8 inch drives, but also have an 8 inch size (50 pin)
cable connection. First though, I must get my extra project table
cleared off ... after my wife finally kicked me out of the dining

room, everything got stacked on the new _spreading out_ table in
the back room ... stacked about 4 deep with projects. Things
would probably get moving if I stopped buying new used hardware.

How about this....

Link two to four (or more) Atari's, via whatever method one deems usable, and write a multi-player game for it. It might take a bit of extra hardware for the link, but keep it simple [silly], and release the game along with plans for any necessary hardware. Now anyone can make their Atari-Gamer's System.....(sorry, can't think of a better name right now :)

This is something that's been tossing around in my noggin for a while. My own specific thoughts on this idea are this...

Link two Atari's constantly talking to one another. Call these two systems a 'station' or 'node'. Then link up more 'nodes'. Now what do you have? Each node computer handles something different. One handles raw display generation/sound w/gfx cell's and anything else, and the other computer in the node drives I guess just about everything else. Controllers could be hooked up to both Atari's if they were needed. Joystick pins could be configured for 'writing', and alter outside displays or other "feedback" systems that are part of the game. Oh and the GTIA can be turned off on the other atari, giving another 30-50% more cpu cycles.

Take this gaming system, and plug SIO2PC on each node, and you have great potential for a massive game. What type of game? Anything you can dream up. Action; it's got more processing power across both computers. Adventure; it could store and retrieve a LARGE world map, all with lots of hi detail. Computer 'players' could have cpu cycles to think.

Hey, I know it's all kinda whacky... the point is it's done on the Atari isn't it? It doesn't mean it won't be as much fun as a PC game... hmmmm.... disturbing thought.... DOOM on the Atari... ;-)

The thing is, it's possible to write a game (or whatever pgm one writes) for this system, and it will run * exactly the same on all Atari's! * PC land has anything from say, 5 'horsepower', to 500 'horsepower', not to mention hardware compatibility with the software.

Anyone ELSE like this gaming system concept? Let's make a space action-
adventure style game for it. Not wing commander, not outpost, not
ms space-sim... something FUN, something INTERACTIVE, something COOL...

Yes, I *do* realise I'm in the Atari 8-bit conference.... <BG>

l8r... call me a dreamer....

>personally use the 130XE. Go figure!

I have the same taste in computers a you do, it appears. :) While
I use my 130XE daily, it is only because of the extra ram that I do so.
If I had the space on my desk to put an 800 on it, I'd use that with
an AXLON RAM upgrade instead (the 130XE fits nicely in the "keyboard
drawer"). If I could upgrade the 1200XL to 128K, and if it would be
compatible with the 130XE's memory expansion, AND if I wasn't lazy and
did the video upgrade on it, ANd if SDX fit into it without modification,
I'd use that as my preferred computer. :) All other things being
equal, I prefer the 1200XL to any Atari computer. Next in line is the
800, followed by the 130XE. The rest have no reason for being these
days, with the possible exception of the XEGM with its detachable
keyboard, IMO.

Not that I wouldn't like to own a complete set of Atari computers..
just need to find a 1400XL and 1450XLD somewhere...grin.

It's amazing how this thread has grown. All that happened was one guy
said "shady', flames, I said he had a point & used a valid term,
more flames & agreements.
Like I said, I don't feel up for trashing Puff in public, I anybody really
wants my side or gripes, take it to email as it is fairly detailed & quite
volumous.
It's also quite old so I'm not even sure if people would consider it relevant
to the current situation.
A few points: Look up shady in the dictionary. It just means "of questionable
merit" doesn't mean he's dishonest or a liar. Joe has a point when he says
you guys are taking this to personal. You're starting to sound like John
Hinkle talking about Jody Foster. Point #2, Do you think Puff himself may
not give a sh*t? Perhaps If you ask him yourself, something like, "Do you
think commercial software producers may think you're a shady character
because of your product line?" I'm sure he'd probably say something in
the affirmative! Point #3 If you don't agree it's an valid term I'm willing
to make an offer so you can double your money. Here's the bet: You mail out
100 letters to commercial software produces with a copy of the CSS ads. One
question in the letter: Do you think these products are of 'questionable
merit' to the computer industry. It'll cost you about $35 for the mailing
& I well give you $1 for each response you get that says they are of value
to the industry. If all 100 respond in your favor I'll even through in an
extra $5 so you can double your money!
Look, it's very nice to defend someone weither they want it or even
deserve it. But if you aren't willing to take the bet then you should back
off a little bit. Don't suspend your intellectual integrity because of
an emotional response to a valid statement. The one thing Glen said that
'had merit' was indicating the view is subjective. If you're a pirate or
need a hard drive or high density floppy attached to your computer, Puff's
the greatest thing since sliced bread. If your a commercial software
producer, Puff & guys like him are just ripoff artist. If you understand
how subjective the issue is, they don't get so bent when you realize
there are other who do not share your perspective.

> 65XE <- same as 800XL but newer (and no PBI? I forget!)
> 130XE <- biggest RAM (128K), had ECI (sorta like PBI)
>
>Reason I say 800XL is best vs. the two XE's is the keyboard. I've touched
>a 130XE before.. I didn't like it! :)
>

Oh, so that's why? I did wonder why someone earlier wanted to swap a 130XE
with an 800XL.

I thought it might have been because the PBI looks a little easier to use
than the ECI thing that would need tracks cut...

Richard =8-]

PS. I agree about the keyboard though - I have to hit the keys quite hard,
else I end up deleting the wrong lines... !

> of games work on'em. PC XFORMR IS A SHAME !!!!!!!

I used to keep my SOUNDBLASTER on IRQ 5, to keep IRQ7 open for printer, or whatever. However, in many cases, IRQ7 is fine for Soundblaster, and many applications use it as the "default" setting for the soundblaster. However, every application that uses the Soundblaster allows you the option of selecting which IRQ, DMA channel, and base address your sound blaster is on, or they will "auto sense" the information. The first exception I've found to this rule has been the PC Xformer 3.0. I had to change my SB back to IRQ7, and then go through all the applications on my hard drive and change their settings to IRQ7 too....since PCXF wouldn't work on anything other than 7, and there doesn't appear to be any way to change it. I'll have to say that the sound is quite imperfect. The sounds are ***VERY*** shrill and piercing to the eardrum.

I'll have to agree with Artem Aleksandrovich Koutchine, who wrote in his message that many games don't work, and most that do work incorrectly. That does seem to be a major problem with PCXF 3.0. The only one of my favorite old games which I have tried which works properly is Donkey Kong. I've been having fun playing that one. Most do NOT work. I wish that they did, and I am hopeful of a future update of PCXF which will be more compatible and address all of the above problems. I have not seen the Commodore 64 emulator, but I would hope that if it is indeed as successful as Koutchine stated, that an equally successful PCXF is possible.

As far as for my own use, I am not disappointed enough with PCXF to send it back. I've been having loads of fun playing with Atari BASIC again, and being able to run at least SOME of my old programs on my PC makes me happy. I'M HOPING FOR IMPROVEMENTS, HOWEVER!!!

: It's a proprietary emulation engine. Actual original code is run in
: emulation. It's just that unless you crack the CD, you'll never be able
: to test it on anything but the packin games.

What is this "crack the CD" stuff? This particular game will be
released on floppy and CD, but even if it was only CD I've never
seen any sort of protection... I've heard this before, that CDs
will make software harder to pirate; I don't get it. It's just
a matter of size, and most games use VERY LITTLE of the CD.

I'd bet anything it's just used for installation to hard disk. There
may be some videos taking up space (like the King's Quest anthology
CD-ROM), but there's nothing really special about the CD format.

I predict much hacking.

NESFLASH: There are no COMMERCIAL software outfits left for the atari8 that I know of except maybe a flybynight or two in Europe, and Puff would be one of the last with things like his backup software, which I'm sure the SuperArchiver could crack (it IS protected by the way). In fact, that was one reason I was considering the Super Archiver, because I really need backups of the backup software, it isn't HD installable... So it could hurt him as well as anyone else.

435. Re: RVerter Type Interface (Instructions)

Source record: 95375

If Bob doesn't release the R:P: he should at least give up the plans so maybe someone else can make them. If you strip away the P: then it might not be too complex to build by hand.

It uses a 16550 Uart inside to provide the buffering. An R:Verter without CTS/RTS is of dubious merit these days.

Joe, in ref to the Stay Puff Marshmellow Man & geeks. About 1/10th the stuff I see in the comp.sys.atari.8bit digest I *NEVER* see on Portal. I assume about 1/10th of the stuff I respond to never gets out.
I just wanted to point out what I figured were reasonable causes of death based on Bill Wilkinson's general state of conditioning.
Now that someone has posted the CI$ numbers of two other BW's, neither of which is in Washington state, I'm inclined to beleive the name is a little more common then I first thought. In other words, accurate about a Bill Wilkinson dieing, it's just probably not the same one we know.

The prices that Michael Current posted are for the TWAUG newsletter, not the book(s). The books ran me about 21.50 pounds sterling to include the postage. I discussed my travails regarding how to send foreign currency in the mail for the book in one of my recent columns in Current Notes. I indeed sent the money to TWAUG (the address he posted). Just wanted to make sure that people didn't get confused about the price.

439. On flaming the remaining 8-bit sources

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-22 04:10:39 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950121175006.20806M-100000@CSOS.ORST.EDU>
Source record: 95379

After reading messages from others concerning dealing with CSS - I just wanted to recapitulate a little bit:

The only reason that I posted my message about my unfortunate experience with CSS is **NOT** out of some personal distaste for Mr. Puff that existed for some other reason. WHY DID I POST THAT, THEN? I said the things that I did because THE SITUATION OCCURED!

I am now in a less-preferable situation - as I have an expensive serial port on my Atari! How expensive?

Black Box+Floppy Board $309.95
SCSI cable $ 15.00
P:R: Cable set $ 15.00
shipping/hand. $ 10.00
Black Box case $ 39.95
shipping/hand. $ 5.00

----
total investment: $394.90

What can I use this thing for? I can set up a serial connection between my PC and my Atari-8. The BB is such a neat hack that although I', upset, I still think it's cool...and the 6502 monitor is great! I wish Bob Puff and CSS the best....I just wish things worked out better for me.

James

440. An auction

Newsgroup: comp.sys.atari.8bit

```
>>> Auction of Ataris, Tandy CoCos and misc. stuff <<<
>>> of that nature. ** KSEWELL@ATHENA.CS.UGA.EDU ** <<<

Hi! This is my first auction... here are a couple things first:

1. Minimum bid increment on every item is $1.
2. Winner pays shipping. I prefer USPS COD 1st class but if you have some
other preference, we'll do it that way.
3. Auction ends late January 31, 1995 at midnight.
4. I will email all bidders updates as needed.
5. Trades have priority over sales.
6. No foreign/overseas orders.
7. If I have more than one of an item, please specify *which* # you want.
8. I can't guarantee anything, but all is okay as far as I know unless noted.

** LOT 1 **** BID #1: $15 (minimum) **
**** BID #2: $15 (minimum) **
Sears Telegames Video Arcade (Atari 2600): woodgrain front # 6 switches # no
power supply # 1 set of paddles
CARTS: Combat # Defender

** LOT 2 **** BID: $50 (minimum) **
Atari 2600: black plastic front with "ATARI 2600" on it # power supply # TV
switchbox and 300/75 OHM adapter # 1 Video Touch Pad (for Star Raiders) # 1 set
of paddles in original box # 1 1982 Atari game catalog # 1 Atari joystick (no
stick cover) # wooden cartridge case with plastic shelves - holds 16 carts #
original box (ends kinda mangled)
CARTS (16): Combat (with Sears TANK PLUS instruction booklet) # Frogs and Flies
# Dark Cavern # Defender # Circus Atari # Cosmic Ark # Star Raiders (with
overlay) # Frogger # Carnival # Casino # Air Sea Battle # River Raid #
Adventures of Tron # Pac-Man # Missile Command # Pitfall!

** LOT 3 **** BID: $15 (minimum) **
Atari 2600: woodgrain front # ON/OFF is a little flaky; just don't hit it while
you're playing # 1 set of paddles # no power supply. TV switchbox
CARTS: Combat # Defender

** LOT 4 **** BID: $30 (minimum) **
Atari 2600: woodgrain front # TV wire frayed (does not affect play) # 1 set of
paddles # power supply # TV switchbox
CARTS: Frogs and Flies # Air Sea Battle # Missile Command # Combat # Defender #
Star Raiders

** LOT 5 **** BID: $15 (minimum) **
Atari 2600: woodgrain front # no power supply # 1 set of paddles # orange toll
free service number on bottom (*I* think it's cool)
```

CART: Combat

** LOT 6 **** BID: $15 (minimum) **
Atari 2600: woodgrain front # no power supply # 1 set of paddles
CART: Combat

** LOT 7 **** BID: $40 (minimum) **
TRS-80 Color Computer 1: works great # black leather carrying case (small seam tear) # TV wire and switchbox # everything in GREAT condition! # very nice - a rare find! :)

** LOT 8 **** BID: $23 (minimum) **
TRS-80 Color Computer 2: 2 Tandy joysticks # works great

** LOT 9 **** BID: $20 (minimum) **
Colorsport VIII pong system: Handball # Hockey # Tennis # Skeet # each game has 2 variations # 4 controllers # original power supply # works great

** LOT 10 **** BID: $15 (minimum) **
Racal-Vadic VA212LC modem: 300/1200 baud # original box and power supply # no manual

** LOT 11 **** BID: $15 (minimum) **
Atari 600XL computer: power supply # TV cable # video is a bit messed up - viewable but annoying; probably fixable? # works fine otherwise

** LOT 12 **** BID #1: $8 (minimum) **
**** BID #2: $8 (minimum) **
"The Pac-Man Album": "Limited Edition Collector Series" # 1980 Picture LP of Pac-Man, Ms. Pac-Man and Baby Pac-Man fleeing a ghost # 8 songs # (this is not Buckner and Garcia's "Pac-Man Fever" LP)

** LOT 13 **** BID: $5 (minimum) **
Alphacom 42 Atari-compatible printer: uses 4 inch thermal paper (includes a half roll) # when plugged in, it hyperactively advances the paper until you unplug it # don't ask me why # maybe fixable or for parts

CARTRIDGES
~~~~~~~~~~
*** Atari 2600 carts ***
Missile Command - unopened box # faded and a little crushed BID: $7
Breakout - with original box # no instructions BID: $5
Space Invaders - with original box *and* instructions BID: $7
Chopper Command - with original box # no instructions BID: $6

*** Atari 5200 carts ***
THESE ARE UNCHECKED BECAUSE I DON'T HAVE AN ATARI 5200 BUT ALL ARE IN
VERY GOOD CONDITION - - - - - - - - - - - - - - - - - NO OVERLAYS
Super Breakout BID #1: $4 Missile Command BID #1: $3
BID #2: $4 BID #2: $3
Defender BID: $5 Galaxian BID: $5
Pac-Man BID: $3
~~~~~~~~~~

*** VIC= 20 *** Blue Meanies From Outer Space - cassette (untested) BID: $2
*** Sega *** Hang On/Astro Warrior (untested) BID: $4

CONTROLLERS
~~~~~~~~~~~
C1 BID: $15 (minimum) - Sunco Tac-3 Atari joystick - stick button, 2 base buttons, all work simultaneously. Nice. White
C2 BID: $3 (minimum) - Generic Atari joystick - hand grip stick; stick button, have to press it hard sometimes. Cheapo black plastic
C3 BID: $15 (minimum) - Wico Command Control - Atari compatible, red round stick, black and red base. One stick button and one base button. Very sturdy
C4 Atari joysticks - work except for one direction - fixable? or parts
BID #1 (no up direction): $1
BID #2 (no left direction): $1
BID #3 (no button; stick cover missing): $1
C5 Commodore Atari-compatible joysticks - b&w base, black stick, one center base button.
BID #1 (set of 2): $10
BID #2 (some directions work, some flaky, some not; single unit): $2
C6 BID: $5 (minimum) - Wico Command Control - doesn't work at all , which is a shame, because this is really nice. Switchable between base button or base/stick button. Red grip stick. The whole thing feels really comfortable, I hope it's not really dead.

FREE STUFF
~~~~~~~~~~
If you win any of the above items, you can take what you want
out of this section. Just ask. FIRST COME, FIRST SERVED!
o Super Mario Bros. 3 (Nintendo) manual
o Dick Tracy (Nintendo) manual
o "Installing the TV/Game Switch Box" booklet from Atari
o miniature folded poster advertising 35 Nintendo games
o Atari 5200 system booklet - pictures of hardware and 20 games
o Atari Football manual - for the 5200, I think. One page is unreadable because someone stuck an entire sheet of decals for something to it.
o Speak & Spell Vowel Power cart manual
o Speak & Spell Super Stumpers cart manual
o Speak & Spell Super Stumpers cart Parents' Guide

MY WANTS
~~~~~~~~
I will consider trading for these items. Just mail me an offer and we'll see if we can work it out.

o Pooyan cart for Intellivision, ColecoVision, Atari 2600 or Atari 8-bit (any format)
o Atari 5200 system
o Crush, Crumble and Chomp for Atari 8-bit (any format, preferably with docs or copies of them)
o Keyboard controllers for Atari 2600 BASIC cart

> It seems a little bit as an early PBI !
>
I have a 128k memory board in my 800, they are rather common, i's made by
Axlon. The memory is 8 banks of 16k each, switched in and out of ram by
software. Very handy as a ramdisk or extending the buffer of some
wordprocessors.
The connector on the motherboard was the subject of discussion here some
time back, seems that it was used for testing the motherboard at the
factory. I for one would like to see it's potential for further
exploitation researched. Any knowledgable people out there with some time
to kill?

The reason gamelink has pretty much failed as a concept is simple.

THERE JUST AREN'T ENOUGH 8-BITTERS LIVING IN PROXIMITY TO EACHOTHER!

That isn't going to change.

Now, if there were a way to link 8-bit games via the INTERNET, there are certainly enough 8-bitters on the internet to make that workable.

>
Actually, it's been done. There's a game out called Maze of Agdagon that supports up to 8 8-bits networked via a "Gamelink II" SIO cable. Only one machine needs the software; the others, once connected, can boot off the host machine.

The game is like MIDI Maze on the ST; it should be at Umich. DataQue has it in a cart, and sell three-way cables. To go eight ways requires a bit of additional hardware in the interface.

The docs included are well done, and even include plans to use paperclips and two SIO cables to hook together two systems.

Dave

447. Trak drives

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-22 06:48:00 UTC
From: da_pate@pavo.concordia.ca
Message-ID: <22JAN199501483435@pavo.concordia.ca>
Source record: 95387

I found some info on the Trak drive in Analog #17 (the disk drive issue). A Trak ad is right in the front. There are apparently three models: ATD1 (Single density), ATD2 (Double density) and AT-1 (DD Slave). With optional extra software (on Eprom) it can run 18 times faster than any other drive.

In Analog's review, I can find the following information on the AT-D2:

Single or Double density. Does not support Atari's Enhanced density. Built in Diagnostics. Track indicator. Write protect switch. Medium noise level. Power switch in front. Fastest formatiing time (about half that of the 1050). Fastest worst-case access time (40% of the 1050 time). Built in parallel printer interface. 2k printer buffer (expandable). Utilities and game software. Optional Turbo software on Eprom ($60 extra).
Size: 3 1/2" x 8 x 11 3/4. 90 day warranty. $499.

Contact info (from March of 1984, so don't hold your breath):

Trak Microcomputer
1511 Ogden Ave
Downers Grove, Illinois 60515

Hope this is some help!

Dave

: shipping/hand. $ 10.00
: Black Box case $ 39.95
: shipping/hand. $ 5.00
: ________
: total investment: $394.90

: What can I use this thing for? I can set up a serial connection between
: my PC and my Atari-8. The BB is such a neat hack that although I',
: upset, I still think it's cool...and the 6502 monitor is great! I wish
: Bob Puff and CSS the best....I just wish things worked out better for me.

If you already had a PC, the BB/FB is an extravagant solution compared to SIO2PC. However, not everyone has or want PCs. Not everyone would be happy spending money on a cheap PC just to use as a SLOW means of accessing mass storage and appreciate the BB/FB and are willing to make the onetime investment. The savings is in the $/meg of hard drives, not the interface. Same with the MIO II. You're only getting what you pay for. Now the CASE, that IS a ripoff. People should make their own cases. The BB case doesn't fit well nor is it particularly effective as a case IMO. I bought one out of laziness myself.

It was unfortunate for you to not be aware of SIO2PC, however, even though the BB/FB is expensive, it is only a fair price for what hardware costs to make these days in SMALL quantities and has clear advantages over SIO2PC.

You should also know that Bob Puff knows that not everyone wants to pay a lot of money when they are just looking for the ONLY R: port for the Atari that supports CTS/RTS. Bob himself created a tough situation for 8-bitters by releasing the MUX and then making it so that the only way each slave could have highspeed modems would have been to buy a BB for every slave. A multiline PRO! version exists which has been STRAPPED by the lack of a CHEAP singleunit highspeed modem interface. OF course, multiline PRO! itself may seem like a dubious thing when 8-bit sysops struggle to get callers as it is (just ask Jim King) but it's still a problem even for single line sysops who use the MUX as a way to have both the BBS and PERSONAL node access a common HD. The BB gets stuck servicing the master so its great R: port winds up being unused.

So Bob DOES in fact want to give 8-bitters something they can afford. Hopefully he WILL release the R:P: eventually, and $60 seems well worth it.

The FB was a promise he had to keep. He made the promise when the BB was desinged with the floppy port on it which was not being utilized. The FB was also quite late, but it arrived. I'm hoping for another miracle (and it will be a miracle) for Bob to get the R:P: out to us.

You should also realize that there is a good market out there for used BB/FBs since they rarely turn up used. If yours doesn't work right, send it to Puff for the onceover, then try to sell it. If it DOES work, then sell it and get some of your money back. You could probably get over $200 for it.

Used BB/FBs are probably the only things you can easily sell these days when most 8-bitters have everything. They're better than MIOs and there are fewer of them around, and few 8-bitters unfortunately are willing to pay full retail for them, so you'd probably have little problem selling it and taking a partial loss. I certainly wouldn't sell it for less than $200. That would be an insult. Now MUXes on the other hand, those are of a more specialized use and therefore have a harder time getting sold (just as Jim King).

449. An auction

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-22 07:12:16 UTC
From: ksewell@athena.cs.uga.edu
Message-ID: <3ft0gg$or2@hobbes.cc.uga.edu>
Source record: 95389

This is a repost of my auction of about 7 or 8 posts ago, minus all the non-Atari 8bit stuff (and considerably shorter! :)...

>>> Auction of Atari 8 bit stuff ** KSEWELL@ATHENA.CS.UGA.EDU ** <<<

Hi! This is my first auction... here are a couple things first:

1. Minimum bid increment on every item is $1.
2. Winner pays shipping. I prefer USPS COD 1st class but if you have some other preference, we'll do it that way.
3. Auction ends late January 31, 1995 at midnight.
4. I will email all bidders updates as needed.
5. Trades have priority over sales.
6. No foreign/overseas orders.
7. If I have more than one of an item, please specify *which* # you want.
8. I can't guarantee anything, but all is okay as far as I know unless noted.

** LOT 10 **** BID: $15 (minimum) **
Racal-Vadic VA212LC modem: 300/1200 baud # original box and power supply # no manual

** LOT 11 **** BID: $15 (minimum) **
Atari 600XL computer: power supply # TV cable # video is a bit messed up - viewable but annoying; probably fixable? # works fine otherwise

** LOT 13 **** BID: $5 (minimum) **
Alphacom 42 Atari-compatible printer: uses 4 inch thermal paper (includes a half roll) # when plugged in, it hyperactively advances the paper until you unplug it # don't ask me why # maybe fixable or for parts

CONTROLLERS
~~~~~~~~~~~
C1 BID: $15 (minimum) - Sunco Tac-3 Atari joystick - stick button, 2 base buttons, all work simultaneously. Nice. White
C2 BID: $3 (minimum) - Generic Atari joystick - hand grip stick; stick button, have to press it hard sometimes. Cheapo black plastic
C3 BID: $15 (minimum) - Wico Command Control - Atari compatible, red round stick, black and red base. One stick button and one base button. Very sturdy
C4 Atari joysticks - work except for one direction - fixable? or parts
BID #1 (no up direction): $1
BID #2 (no left direction): $1
BID #3 (no button; stick cover missing): $1
C5 Commodore Atari-compatible joysticks - b&w base, black stick, one center base button.
BID #1 (set of 2): $10
BID #2 (some directions work, some flaky, some not; single unit): $2
~~~~~~~~~~~

C6 BID: $5 (minimum) - Wico Command Control - doesn't work at all , which is a shame, because this is really nice. Switchable between base button or base/stick button. Red grip stick. The whole thing feels really comfortable, I hope it's not really dead.

FREE STUFF
~~~~~~~~~~
If you win any of the above items, you can take what you want
out of this section. Just ask. FIRST COME, FIRST SERVED!
o Super Mario Bros. 3 (Nintendo) manual
o Dick Tracy (Nintendo) manual
o "Installing the TV/Game Switch Box" booklet from Atari
o miniature folded poster advertising 35 Nintendo games
o Atari 5200 system booklet - pictures of hardware and 20 games
o Atari Football manual - for the 5200, I think. One page is unreadable because someone stuck an entire sheet of decals for something to it.
o Speak & Spell Vowel Power cart manual
o Speak & Spell Super Stumpers cart manual
o Speak & Spell Super Stumpers cart Parents' Guide

MY WANTS
~~~~~~~~
I will consider trading for these items. Just mail me an offer and we'll see if we can work it out.

o Pooyan cart for Intellivision, ColecoVision, Atari 2600 or Atari 8-bit (any format)
o Atari 5200 system
o Crush, Crumble and Chomp for Atari 8-bit (any format, preferably with docs or copies of them)
o Keyboard controllers for Atari 2600 BASIC cart

Just thinking about my old MAC65 Assembler brings a tear to my eye.
But seriously, I think there are timing charts in the back of the old
Atari Tech Ref Notes. Atari also used to sell a printout of the OS in
ASM code format. I'm talking old 400/800 days here, but any timing
changes that were later made are basically compatible.

Ah, text adventures. :)

While my first computer games (other than Lunar Lander on a
Heathkit at school) were graphical, the ones I played the most in the
early years were the Infocom text/puzzle games. Remember the Invisiclues
books? :)
I remember bringing this up, years later, to a fellow-Atarian.
His response was, "So you had this great machine that had the best
graphics capability of its time, and you used it for TEXT GAMES?!?!"

I have to disagree about that! Sorry, but from what I heard from someone who wrote a C64 emulator I know that it's extremely hard to emulate things like C64 sound and music effects etc. It's a fact that PC XFORMER 3.0 is still unfinished! IMHO it is currently better to use Xf 2.5 and wait for (free???) updates. And Artem Aleksandrovich is ABSOLUTELY right when he says that most C64 emulators are MUCH better.

Source record: 95396
Body handling: HTML body converted to readable text

Well this well probably sound confused, but only because I am. I don't
think you may have much luck without counting cycles during the display
because of the correlation between clock cyles & display, but here's
what I think goes on. If you scope an Atari !HALT line, it activates
in a perfect square wave with the !HALT being low 1/3 of the time during
the display. I've never noticed any of the other events like refresh occuring
to the !HALT so I think it's safe to assume they occur as an interrupt & have
no effect during the screen display. Once the screen is started, it's a done
deal & that's all you have to worry about.
The GTIA gets the feed from the 3.59 crystal & uses that as the
dot clock. If you've ever taken a look at the 6545 display chip where they
run the 74ls165 dot clock at 7.18 mHz or so you'll see what I'm
talking about. The GTIA sends out a 3.59/2 or 1.79 mHz system clock.
There is no such thing as a dot clock in an Atari, I'm guessing at this
function is in the GTIA's silicon as I don't have X-ray vision.
Anyway all screens no matter what mode are are exactly the 228 color
clocks wide. You can change from wide to narrow playfields, graphic 0
to graphic 8, 40 column display, 20 column display, doesn't matter. All
that happens in the case of narrow & wide playfields is the portion of
the 228 color clock display period is changed, not the actual number of
cycles. For things like the 20 vs 40 column displays, the 'dot clock'
we don't really know about inside the GTIA just clocks at 1/2 the 40
column rate so the characters are twice as wide in 20 column mode. It's
still active for exactly 228 color clocks.
Hmmm, you wanted to know about things like refresh interrupts, & how
about DLI's, & I seem to be digressing. But then I'm not exactly clear
on what you need to know since I've never written an emulator.
A DLI just allows the 6502 to restart processing during the horizontal
retrace period. What happens when you write to WSYNC is the !HALT line
is brought low 7 machine cycles before an attemp to draw the next
horizontal line is drawn. Without this "extra" safety margin (No excuse
here, I could just scope my Atari to find out for sure) the speed at
which the 6502 responds to the !HALT line depends on what instruction
it was doing & how many ticks of the clock had already occured during
that instruction. In other words, slightly different response to
freeing the buss everytime a horizontal display line gets drawn.
This causes unsightly flicker or color changes 3/4 of the way accros the
screen. Now that I haven't answered any of your questions. What an emulator
has to do is process these DLI's fast enough to perform the needed work
& get back to letting the Antic/GTIA in plenty of time for them to do the
display work. When you think about it, a XT could probably emulate every
thing but this brand of display functions, it just wouldn't be fast enough
to do the DLI stuffs. I think someone even complained about their version

of Derek's emulator not being able to do DLI's properly on a slower machine.

I was thrilled at the possibility of doing this. I was a message which pointed out this program at this FTP site:

>ftp://ftp.cs.dartmouth.edu/pub/crow/anad207.zip

I downloaded that program 3 times with Zmodem, and there are bad bytes/failed CRC checks all through the ZIP. More than one file is affected, and, unfortunately, the main program is one of them. Can someoone suggest an alternate site, or an alternate program and site?

Thanks.

James

461. Atari 800 question...

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-22 20:42:24 UTC
From: ken@genesis.mc.maricopa.edu
Message-ID: <3fufvh$ol0@names.maricopa.edu>
Source record: 95400

My girlfriend picked up an Atari 800 for me really cheap at a thrift store. It is the older kind with the 4 joystick ports and the 2 cart slots. I noticed that on the right hand side of the unit (the side with the power switch, etc) there are 2 ribbon cables hanging out. They have been cut short . . . so short that the ends are almost flush with the unit. Each of this ribbon cables is composed of 9 wires. I don't have a power supply for it, so I can't test it to see if it works. So do these ribbon cables mean that the computer won't work, or does it look like it belonged to one of you 'tinkerers' who tried to add something to it?

Also, what are the specs on the power supply I'd need to use this computer?

Thanks!

: hard drive and change their settings to IRQ7 too....since PCXF wouldn't
: work on anything other than 7, and there doesn't appear to be any way to
: change it. I'll have to say that the sound is quite imperfect. The
: sounds are ***VERY*** shrill and piercing to the eardrum.

Well, i have my SB on irq7 and tried all other combinations od irq and
dma but still no sound in BOULDER DASH and ZYBEX. Whatta hell. We all have
to admit that PC XFORMER need a lot of work and i am very very sorry
that i bought it. Do you know how i can get my money back ?
About C64S (Emulator of Commodore 64). I have the last version. This
us beautiful. Sound, video, all tricks work except FAST LOADERS but
they promised to do fast loaders in the next version. About fun, well,
i have enough fun writting my own BBS software in ASM and C. That's
a lot of fun.

So, what about money ? Can i get it back and how ?

About all these "An auction" posts of mine... sorry!! My newsreader was screwed up and I accidentally posted the same 82-line auction list 3 times in a row. I've deleted two of them. *sigh* Back when Ataris were king (in the sense that they aren't *now*, despite what we in this group think! :) there *was* no Internet and I smiled a lot more....

There's no binaries group for the Atari 8-bit, but when CIS gets FTP you can
look at the Atari archive at the University of Michigan. Either
FTP archive.umich.edu or gopher gopher.archive.umich.edu, then
go to Atari/8bit; plenty of files there!

Dave

My 1200xl meets all those requirements except the video: I have the
RAMbo 256K upgrade (XE-compatible except for the little-used
independent ANTIC banking of the 130XE). I have modified the video so
it's better than it was, but I haven't done the better upgrade that
was published in AC. And my SDX cartridge fits in the slot with just
a little extra force and wiggling.

> All other things being
>equal, I prefer the 1200XL to any Atari computer. Next in line is the

>keyboard, IMO.

What about the 800XL? I'd take that over an 800 most of the time. So
many useful things need at least an XL to work.

I use the 1200XL as my primary Atari, and when I encouter that rare
program that doesn't like it I switch to the 64K 800XL. I wouldn't
mind getting an 800 (and adding memory to the 800XL), but after that
I'd have no use for any others.

Let me see, I spend $35 right away to send what the recipients would
undoubtedly consider junk mail, and you _promise_ to give me $1
for each positive response. Sounds like you'd have the advantage even
if he's a saint. If I'm not willing to take the bet it's for three
reasons:
1 - I don't take bets.
2 - The recipients are more likely to trash it than to respond either
way.
3 - I have to trust you to pay for the positive responses.

Also, we don't care as much about whether his products are good for
"the industry" as about whether they're good for the users.

Howdy.
I'm doing an auction of all sorts of video game and computer equipment,
including the console(s)/computer(s) discussed here.
Below are only the items of interest to this group.
To see the entire auction list, please go to rec.games.video.marketplace
and see the post titled Big Ugly Auction. Or, e-mail me and I will send
you a current auction list.

Thanks
-Jason

SOFTWARE/CARTRIDGES---

---Atari 8-bit computer software:---
Atariwriter (Atari, cartridge, box + manual, works)

470. Atari 8-bit emulator for the PC

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-22 23:00:38 UTC
From: David@holodeck.demon.co.uk
Message-ID: <484754723wnr@holodeck.demon.co.uk>
Source record: 95309

Does anyone know of a software based Atari 8-bit emulator for the PC?

Over the last 11 years I`ve had more than my fair share of Atari machines. After first buying a Sinclair ZX Spectrum I visited a mate who had just bought himself an Atari 400. We all told him he must have been mad. "Go and buy a Spectrum!". Then we saw the graphics and heard the sound. My wife wasn't too impressed but I ended up having a 400 within a couple of weeks. Infact I've still go access to it.

From there it went on and on......Atari 400 - Atari 800 - Atari 1030 XE with a 1050 disc drive. What a brillient piece of kit! We even ended up designing a circuit board for the 1050 allowing it to double the disc capacity. I think we made about 20. Very time consuming but what an experience! I`ve had about 3 Atari ST's.

That was all in the passed. I now just have my trusty PC. Each time I wanted a new machine I had to sell the other to boost my money.

I see that there are software emulators of the ZX Spectrum and Commodore 64 but are there any 8-bit Atari ones - no good without software of course.

Over to you........

Dave....

No, there's no .binaries group for the Atari 8bit, but there is the
Atari Archives and other FTP sites. AA is atari.archive.umich.edu,
atari/8bit. You can also fetch files through e-mail by sending e-mail
to the "BART" server there. Check the FAQs posted here monthly for
information on using BART and also for a list of other FTP sites and
WWW sites.

It's not perfect (yet), but there's the PC Xformer from Branch Always Software.
The free test versions (2.0 and 2.5) are available by FTP and online services.
The first commercial release (3.0) costs $29.95 and can be purchased from many
Atari 8-bit and ST dealers as well as directly from the author, Branch Always
Software (e-mail: BRASOFT@AOL.COM; p-mail: 14150 N.E. 20th St. Ste. 302
Bellevue WA 98007 USA; info: 206-369-5513; fax: 206-885-5893). They
require about 640K and run on 386/486/Pentium PCs with VGA or MCGA (320x200
resolution, 256 colors). It's probably best to run them on a 486 or better.

You can use ST Xformer (XFD) and SIO2PC (ATR) disk image files, as well as
installing files directly off of your PC. 2.5 supports (as best it can)
NMI & IRQ interrupts, GTIA/ANTIC graphics, Display Lists, DLInterrupts,
Player/Missile Graphics, 256 colors. 3.0 supports that plus sound,
joystick, modem, printer support (through your PC's SoundBlaster, PC joy-
stick, PC modem and PC printer) as well as Player/Missile Graphics
collision detection (used in a lot of games).

As I said, it's not perfect, but Branch Always Software has promised to
release upgrades to registered users for a hopefully minimal charge.

PC Xformer 3.0 comes with a ~40 page printed manual and Atari reference
which covers Intro/Requirements/Features/Setup, Getting Around (loading,
using MyDOS and Atari DOS, using BASIC, using the Config. menu (this
is explained in more detail in the disk-based ammendum to the manual at
the moment)), Transferring files and useful file utilities, Support.
It also contains 12 appendicies: Paths and Directories, Keyboard Ref.,
ATASCII characters (all 128 are printed), Atari Devices and I/O,
Atari Editor Controls, Contacting other Atari Users, Error Codes
(for the OS, BASIC, MyDOS, Atari DOS, SpartaDOS and TurboBASIC XL),
Color Palette, Graphics modes, Sound Scales, and a 13 page glossary!!!

I highly recommend PC Xformer, especially to those who can't get a hold
of a real Atari or don't have room for one or something. I cannot
emphasize enough that it isn't complete, but remember, you CAN get

upgrades when they arrive! (Also, it's the only working 8-bit Atari
emulator out for ANY platform for the moment, so unless you can live
without it, this is the one to get!!!)

Anyway.. happy emulating! Also read up on the comp.sys.atari.8bit FAQ
and the Unofficial Atari Newbie, Emulator FAQ for help with Atari's
in general, specific Atari related information, and emulated Atari details.

Go to the atari archive at umich (archive.umich.edu) or one of its mirrors.
In the dir Atari/8bit/pcxformer you'll find PC Xformer 2.5? a freeware
version of an emulator. The full version is a retail product, $30 US. You
can get more info from the FAQ (posted at the beginning of the month).

My current 8bit Atari setup is "almost" like the mentioned dream setup. I have virtually everything tucked inside a huge d/i/gi/t/a/l Rainbow 100 case (it has TONS of space and one hell of a strong power supply) - with the XL remaining external.

Included in the HD case are:

Adaptec 4000a connected to two 40meg MFM hard drives
256k MIO
720k 3.5inch disk drive
1.2m 5.25inch disk drive
ATR8000 mainboard

Anybody wanting photos for digitizing, etc.. feel free to contact me! [grin]

From: diskdet2@aol.com
Message-ID: <3fvg56$t7j@newsbf02.news.aol.com>
Source record: 95321

Trak went out of business about 9 months after they started sell in the Atari drives. The Traks have some very nice things about them. As a repair person, they have many problems. The power supplies were the worst. The turbo was just a track buffers. The fact that is ran so fast, is the amount of SRAM installed in the drive. 2k standard. It did have the printer port in it, but they did not key the plug. If pluged in backwards, it would damage the mother board. The slave drive works the same as the Percoms. I still have 3 or 4 Trak for my computer museum.

Message-ID: <hu6Yq8d.ftooned@delphi.com>
Source record: 95326

Hi All,

I need to put my 2 cents worth in on this one...

What Bob Puff has done for this community is nothing short of AMAZING!!

I know that he has been doing a lot of work with audio amplifiers,
and believe me, all it takes is one HUGE and expensive project to
throw you completely out of sync. It just so happened that the first
project I started on was exactly just that. (MARS8)

While FTe is not FTe's track record for "new" products shipping on-time is
pretty
dismal to say the least. But, The Sweet 16 is finished and now shipping
with the MIO II running close behind. If I knew what I do now,
I would have been scared-to-death about taking over the ICD/OSS
products simply due to lack of sufficient capital and resources
to "pull it off".

I've probably pissed more people off in the first year of operations
here, than Bob has in the last 5. The important thing to remember
here is that neither Bob or I is out to rip anybody off.

Whereas CSS may be moving in and alternate direction now, I feel
that Bob Puff has single-handedly kept these machines alive for
the past 3-5 years. FTe has some pretty neat products soon
to be released, not to mention that a phone call to B&C will
give you access to virtually all of the ICD/OSS/Newell stuff.

But... In all seriousness, I can't hold a candle to Puff as far
as programming, electronics, or customer support. I have a much
greater vision for the Atari's than he does, and have acted on it the
best way that I know how. FTe is still here and hanging on, but
if this is what I have to look forward to when operations do shut
down at some point in the future, I'm a little dissapointed.

Mike

P.S. Oh yea... Bill Wilkinson Gay?? (Get-REAL!!!!!!!!)

>I have a 128k memory board in my 800, they are rather common, i's made by
>Axlon. The memory is 8 banks of 16k each, switched in and out of ram by
>software.
Does this mean, that you will still need three boards to have full
48k RAM capacity ?
Could you use this board in any RAM-Slot or does it still work in one ?
Have you any idea how do they switch the banks ? D6xx ?

Thank you !
Matt

By the way - anybody out there (especially in Germany) having the scematics
of the ATARI 800 - I only have the ABBUC - copies (with very bad quality)
and so I'm interested in better ones !

Hello !!!

If I remember correctly in a magazine called "HEXENKUECHE" by Peter Finzel
he fixed out the exact cycles the Antic needs for DMA-refresh and
generating the picture in different graphic modes.
I cant remember it, but I know that after DMA and VBI you will only have
1.160.000 cycles per second.

But if noone could help you, I 'll try to find the figures.
(It's a little bit difficult, because my internet-computer is in the
University .)

I'm looking for a disk drive, but I don't know where to look. These are
the features I want, and if anyone's selling something like this used -
or knows of a place to get one - get in touch.

-3.5" disks
-double sided, 720K (or 1.44MB if possible)
-connects to SIO (no need for a black-box)
-Ultraspeed, compatible with the US+ OS.

That's about it... does such a drive exist???

I'm not sure, but I believe that 'Ten Little Indians' was part of the
'Mysterious Adventures' series. I remember I had another one game of
those games, 'The Golden Baton'. That game, and probably the whole
series, was published by a company called Channel 8. Tape only, no
graphics for the Atari 8-bit. Typically a blue screen with white
characters. I believe Brian Howarth (sp?) was the author of 'The Golden
Baton'.

The tape version for the Atari had a two-stage loading sequence. The first
part displayed simple, animated birds. The birds joined and formed the
'8' in the company's name, 'Channel 8'.

Glenn, if you really want to know some of the stuff Bob has said/done, take it to E-mail. I'm of the opinion that no matter what I say, the only thing you care about is being able to buy the product line CSS sells. It's a valid judgement on your part to say things => his hardware & dealings with me outweigh any toes he may have stepped on. Most of my complaints are about 7-8 years old & only relate indirectly to anything currently going on. We were both members of CI$ for several years & much of what I have to say relates to that time period. There were still quite a few people that made a living off Atari at that time that were on CI$ & in business at that time. I can be as specific as you like with quotes, but I can only guess at Puff's motives for making these statements. I'm sure it's a real boring read to anybody but maybe you or I so why waste band width.

The axlon ram disk was installed in the center slot of the 800. This was the only slot it could be installed. The Axlon had it's own 16 k., so you had one 16k in the slot after to OS the Axlon and then one more 16K.. In my modified 800i have: Ramrod OS with Omnimon 32K bank switchable, Next one 32k ram board the axlon upgraded to 512K with 256K chips. and last and Autin Franklin 80 col. Color video board (very rare). I also have installed the switchs for the banks select and on, off, and ram disk on, off right above the system reset. Also with Omnimon install I have the cold start reset. I also install two switched to turn the cartridge ports (right and left) on and off. This way I can leave Both Basic and Monkey wrench installed all the time.

Greetings all. I have been off the net for a while now (between leaving school and getting a new account) and when I left, there were several people working on 8-bit emulators for IBM-PCs and/or X-Windows. I was wondering what the status of these projects were, and if there were any working emulators out there that will run on MS-DOS/Windows or Linux/X-Windows.

Also, I would appreciate any pointers I can get to ways of upgrading my old Atari (130XE) with more memory, HD space, et. al.

Thanks in advance for any help,

Matthew E. Bernold

>
>It was a very well written article. When I finally got my first 810
>a couple of months later, I didn't even need to read the DOS manual.
>Thanks to that column, I already knew how to use most of the basic
>DOS commands. David and Sandy Small also wrote a number of software
>reviews for Creative Computing. Their reviews were always right on
>target, and usually entertaining as well.

Dave also wrote semi-regularly for Current Notes back several
years ago. I always enjoyed his articles not only for the
reviews/general information it contained, but for the background
and historical information that they contained. I don't regret
giving away the magazines, but I wish I had kept a copy of his
articles. It would be nice if they could be uploaded for all
to read, but CN is copyrighted and I don't have them any more
anyway.

>I read recently on the 'net that his company, "Gadgets by Small,"
>had recently filed for bankruptcy. Maybe someone else in this
>group has the details.

This is sad but not unexpected news. Dave pretty much tied
his wagon to the ST computer and when the market dried up,
I can imagine what happened to his business.

Shanghai is an excellent clone of Mai Jong, it was released by
Activision in the late 1980s. In Europe it was released in Germany
but not the UK, however several years after its release some units
filtered into the UK through one or two dealers.
The graphics are monochrome and highly detailed, but the author has
used (I think) PMGs to colourise (colorize!) the upper layers so you
can tell the difference. Everything is controlled with a pointer
on screen and accessed from drop-down menus, and yes there is a mouse
option.

This is the best version of Mai Jong I have ever seen for the 8-bit,
I have certainly played it for many hours.

Really, you shouldn't be disappointed at all. Any business
is going to encounter some of these sorts of comments, as no business
is perfect (they're run by humans, remember? [G]).
As the saying goes, when you have a shiny new baloon, needles
abound. :)
So, don't take it too personally when folks critisize you or
your business. Most who do so don't mean any harm, they're just voicing
their opinions for a variety of reasons. Those that do mean harm don't
really matter in my experience. :)
When I released my "door game" for the MS-DOs platform, I
experienced all sorts of negative comments. I also got a lot of supportive
ones. I expect more of both types as time goes on. It's all part of
the business game. :)

What you are doing is good, and you obviously believe in it. So
long as there are still people out here willing and able to buy your
products, that's all the justification you need for what you do.

-Joe

: That's about it... does such a drive exist???

It would have, from the factory, if Atari hadn't chickened out. So we
got the XF551 instead. The 720K mod for the XF is what you want.

There is a european solution too that supports 1.44s, called HDI.

Slower 720K access is a lot simpler. Any slave-capable drive like a
Percom can handle that.

506. Re: Connecting 2 Ataris

Newsgroup: comp.sys.atari.8bit

From: krishna@primenet.com
Message-ID: <3g1pkc$bi0@news.primenet.com>
Source record: 95258

Mere mortal Tommy provoked me by writing:
: What about to connect two Ataris thru one joystick plug? For example,
: with two lines like simple RS 232? (just an idea)

The data rate would suck. Fine for simple pipe communication like a comlynx cable, but not as a networking solution. 2 joystick ports on the other hand, that would work pretty well. They used to run hard drives through 2 joystick ports after all. It becomes a parallel connection rather than serial that way.

507. ATR8000 floppy drive questions

508. Bill Wilkinson responds

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-24 03:04:15 UTC
From: ken@cup.hp.com
Message-ID: <D2w373.89K@cup.hp.com>
Source record: 95346

Following is a message Bill Wilkinson asked me to post to the net after I sent him e-mail regarding his reputed death here on the net. I was pretty sure the old telephone game from first grade (where a statement is whispered from person to person around the room, and the last person tells what he heard, which is never the original statement) had transformed Jay Miner's death (of kidney problems if I'm not mistaken) into Bill's death of AIDS.

Anyway, here is Bill's message.

```
| Ken Sumrall | Internet: ken@cup.hp.com |
| HP California Language Labs | UUCP: ...!hplabs!hpda!ken |
| "I'd stomp desert dope heads for some gas in my moped!" - Bill the Cat |
| "What a stupid world" -Calvin (speaking to Hobbes) |
```

==========

Yes, Bill Wilkinson is still alive and (except for grayer hair [impossible!] and poorer eyesight [improbable?]) he is still pretty much well.

I have, alas, deserted the Atari world (well, it's pretty tough to make a living doing Atari-related software today, isn't it?). Oh, we still have three ST machines at home (and I wouldn't mind finding a copy of MidiMaze one of these days--don't ask me why I never got it before--though I am very reluctant to spend anything further on the ST), and my son still uses the ST for word processing and a bit of BBS surfing, but for all intents and purposes I am now a PC user. Yes, I mean as in 486 and IDE and SVGA and all that stuff.

It's hard to resist the allure of CD-ROM encyclopedias, 3-volume CD games with full-motion video, Borland C++ 4.0, and a _REAL_ WYSIWYG word processor (Microslop Word).

I now live in the Seattle area [yes, Microslush territory], and the good part about that is living on an acre plus in the semi-country (imagine me with chickens--and moles). I don't even mind the liquid sunshine, though I could do without ice during the winter.

I work for a company called "Asymetrix Corporation." We are owned, effectively, by Paul Allen, the co-founder of Microsoft (you know, the poor guy who is only worth 4 or 5 billion bucks, about half Bill Gates' assets). Asymetrix's claim to fame is a hyper-card-like product ("ToolBook" and "Multimedia ToolBook") and a supporting cast, all exclusively for the PC. Asymetrix's "mission statement" says it is devoted to Windows and Multimedia.

What am I doing now? I can't tell you in detail, but I will say that I am developing under Microsquish Windows NT [which, despite my misgivings, isn't too bad to work with!] and am helping to create a product that, all in all, isn't TOO surprising a reach from the kind of stuff OSS used to work on.

I've given up the glamorous (and incredibly unprofitable) life of a small business owner/manager and in fact am not even a manager any more. I'm back to developing, and I think I like it a lot. Still, every so often I stare over at my (still retained) stack of OSS manuals, etc., and wish we could do it over again. But life goes on, even if Atari doesn't.

Friends are invited to write. Enemies should beware of email bombs (I hope I'm kidding). If you get a copy of a note a lot like this one, it's because you didn't ask a specific enough question.

Bill Wilkinson

509. ATR8000 for trade

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-24 03:20:38 UTC
From: mstatz@cei.net
Message-ID: <3g1rm6$2f4@ren.cei.net>
Source record: 95347

Okay - I've given up trying to fix this up the way I want, so here goes...

I have here in my grubby little hands (they *are*, too - I just stoked the fireplace) a (reasonably) complete ATR8000 unit (plus a box of cables); serial #3289; software rev. 3.02+; board marked (99100 rev c) in it's case - no software. As far as I know, it works. I have installed new DRAMs, checked the filter caps, talked with it, petted it, etc..

I just have no software and have been unable to get any.

I need a replacement 800XL (easy, you say? there is more!).

I am willing to trade the ATR + cables, manual and my blessing for a fresh 800XL *and* a nice Commodore-style Color monitor.

...or...

I'll swap an 850 for an 800XL and usable ATR config disks, CP/M (and a hard drive controller adapter for the ATR, If I can get one...)

...or...

Or I'll dump the whole pile for an 800XL and a Black Box (boy, yer dreamin' now!).

Any and all combinations of the above will be considered (I'm okay for software and 1050's - but my XL is dead and my reg 800 won't boot Sparta and read my collection of USD Doubled disks...)

Please help a former Atari salesman back on his feet....

Mark "Give 'till it *hurts*" Statzer

I have Don Bluth's Space Ace CD for DOS. It is by the same guy who made Dragon's Lair CD, except it is set in the future, not in the past. I would like to trade it for a working Atari 800 XL or XE. I would also consider trading it for 2 Atari Lynx games, or some Atari 7800 cartridges. E-mail me if interested.

511. other IBM CD games for trade!

I have some more CD's I would trade too. (for 800XL or XE, or 7800 games
or Lynx games)

Return to Ringworld CD (based on Larry Niven's Sci-Fi book, adventure)
Space Quest 4 CD (Sierra's Roger Wilco on yet another multimedia adventure)
King's Quest 6 CD (save princess Cassima! set in a magical kingdom)
Leisure Suit Larry 6 CD (adult oriented high-res adventure game)
MegaRace CD (3-D virtual shoot-em-up)
Dungeon Hack 3.5" (D&D game that is different every time you play!)
Merchant Prince 3.5" (best trading empire game I've seen, good engine)

e-mail me if interested!

James! :) Read the disks' boxes! They should say something like:

Unformatted: 1mb
MS DOS: 720k
Macintosh: 800k

Those are DOUBLE-density. HIGH-density are:

1) More expensive
2) Have a hole on the left top (opposite side of the Write-Protection one)

Good luck! (Be sure to find a good deal. Best I can find lately (other
than buying in bulk) is about 65c per disk.)

How much software supports 1020's though? Most support EPSON, quite a few support, like, the XMM801, and some supports "Whatever it can, you supply the codes for it though."

The 1020 is the plotter, isn't it? (Opps.. yeah, "pens" was in the list of items it came with).

Well, for $15 it'd be not-to-much-to-waste just to play with it, but seeing as I don't have a printer at ALL (for PC OR Atari (OR my brother's Mac)), do you happen to know if ALLTRONICS happens to have any dot-matrix printers in there?

Ehhh.. maybe I should wait for R:P:Connection and get a Bubble Jet. :)

I have, somewhere, buried among the remains of various hardware projects, full
plans and software and even a working joystick to joystick cable.
It has a control line in each direction, plus three data lines. If I can find
all the docs and software, I'll sned it to the archive.

Is he moving out of the 8-bit completely, or just diversifying?
I hope he hangs on a little longer. There are several products of his
that I have yet to buy. All my 8-bit hardware that needs modification is
back home in Alaska and I'm in school in Oregon. I plan on being a CSS
customer in the future, despite the fact that I feel a little "wronged"
by him.

>
> While FTe is not FTe's track record for "new" products shipping on-time is
> pretty

I didn't slight Puff on this account, and I will ***NEVER***
slight a small outfit for that. The reasons for delayed shipment on
something as sophisticated as electronics (particularly modifications) is
completely understandable. Now Atari, on the other hand....

> dismal to say the least. But, The Sweet 16 is finished and now shipping
> with the MIO II running close behind. If I knew what I do now,

I don't know anything about EITHER of these projects, but judging
from the anxious feelings I get when I think about what they could be, I
can say that I want both!!!! WHAT ARE THESE??? 65816 and IDE
interface?? YES! YES!!

Did you ever get the MARS8 finished? I've been wanting one of
those for a looooooooong time. I've been wanting a SpartaDos X cartridge
for YEARS!!! I'm the guy who wrote from Alaska a couple of
times...(Heh..as if you're going to remember individuals....) There
hasn't been an Atari dealer around me since Sparta was in
beta-test....(well...maybe there was until Sparta 3.2 was new).

> Whereas CSS may be moving in and alternate direction now, I feel

"Moving in an alternate direction???" Uh-oh! I'd better order fast, huh? I agree completely that he has kept the fire burning....but why couldn't he just contact me? I'd made so many attempts!

As for FTe....you're obviously in contact with people. I don't even have to come looking for you...you're on the Internet...you have a BBS that (I believe) is networked with the other Atari boards. Of course I'm going to buy your stuff. I'm sure that if I have a question after I buy it, you'd answer it. Having said that, I fathom I'd never be pissed at you. Puff isn't on the Internet, BBS isn't networked, and didn't answer US MAIL, at least not from me.

>
> But... In all seriousness, I can't hold a candle to Puff as far

>

Once again, you lead me to believe that he has shut down. I hope not. If FTe IS offering the MARS8 and Sweet 16 (whch, I assume, is a 65816), and the MIO II becomes a reality, I'd say you've been more than acting on a vision...'been kickin' ass.

I don't think you need to be disappointed, however. Do you know why I am miffed at Bob Puff? You probably are a buddy of his, and you don't know me from dirt so you probably won't believe me (there are, after all, numerous assholes out in the world of customers, and you never know who to believe), but I'll tell you exactly:

I was out of the 8-bit scene for YEARS (Alaska). All of a sudden, I get on the Atari boards and hear of all this great stuff....the BLACK BOX!!! What more could you **POSSIBLY** want? Hard drives were so expensive when I last had my 8-bit that it was OUT of the question. Here it was, January 1994 and I could afford a whole PC...much less a hard drive for the Atari8. All that stuff in the BB - and the Floppy Board...that sounds so incredible...and all I have to do is get a SCSI hard drive and turn off parity check.

It wasn't but a matter of days until I called and ordered. Altogether, I spent just short of $400 on the BB. That doesn't include the high-density floppy drives, the SCSI hard drive, the PC case and power supplies, SCSI cables. I am telling you that I spend HUNDREDS on the old 8-bit - and I didn't mind a bit, IF I COULD GET IT TO WORK.

I got the serial port working, but the printer would not. I'd hook up the 850 (have a whole stack of them) and it would work. Obviously, not the printer. I am not new to this game. I know how to hook up a printer. The BB cable is so nonstandard that I got one from Puff when I ordered it. So the printer doesn't work.

I got the floppy board working...partly. I was so impressed I couldn't believe it. 360K and 1.2MB drives were a true marvel. Also, the ROM on the BB loaded in my OS and made my Happy drive do Warp speed....even on the SIO!! Then I tried 1.44. Didn't work!! So I heard that some brands of 1.44's don't agree with the BB. So I called a PC friend and traded my BRAND NEW drive for his USED brand (but I knew it worked). Got home; tried it. Didn't work. So the 1.44 didn't work.

Then, I kept losing files on the HD disks. It just kept happening. So someone told me there was a problem with Sparta 3.2d...and offered me a Sparta 3.2c - I don't know if there was such a thing...could have been someone's bootleg hack...I don't know. I just wanted to try it. It was supposed to fix the problem that some people say Sparta 3.2c had which caused lost files.... No, it didn't work. I kept losing files. No, I didn't have a CRT demagnetizer there. My monitor was a long way away. I used new OR old disks. So the floppys that were on the Floppy Board were unreliable.

Then, I decided to hook up the hard drive. I consulted with Puff about getting the right kind, and was told that any drive that I could DISABLE parity on, would work. Avoid certain Quantum drives, etc. I can't even remember which one I had, but it just WOULDN'T RECOGNIZE it. I got the cables and software from Puff. So the hard drive doesn't work.

With this many problems, there is NO WAY that I can just call up Bob while he has a soldering iron in his hand and explain. He'd think I was loco. My situation was complex, and my problems were manifold. In order to explain what was happening, I would have to WRITE it down in a clear, understandable mannor. By the time I addressed the last problem, the first one would be forgotten.

I wrote Bob, and explained. I was **NEVER*** and I mean **NEVER** an asshole. I tried to be polite, and I tried to be pleading. While I could see someone sending it back and demanding a refund, I had **NO** intentions of that. I just wanted to get things working. That's all. I wrote him. I told him that I would be happy to send everything in and have him check it out...and **I** would be happy to pay ALL COSTS involved. I figured I had several hundred invested now, and what would a little more be to get things going?

I ****NEVER**** got a reply. I sent the letter more than once. I think the least time, I even included a self-addressed, stamped envelope. What more could I have done? What possibly? I sent it to two addresses; once to "Bob Puff" at such-and-such PO BOX and again at CSS. What more was there? I just don't know. How could that be? From someone whom I thought of as being so "great?"

Actually, I never did anything about it, either. I figured if Puff wanted to help me, he would have gotten ahold of me. I didn't want to send any nasty letters because (1) I don't enjoy that sort of thing, and (2) something bad could have happened to the man (could be dead, for all I know). I figured I'd just sit on it for a while. In the meantime, I sold the hard drive (at a loss, of course, since it was new and HD prices are falling all the time) to an Amiga owner who fired it up first go. I bought second-hand parts and made PC out of the case and floppy drives, and sold it. I never did anything more.

I'd say that *IF* in fact there is any legitimacy to my claim of having difficulty (that is, unless I am a total liar), I have gone pretty easy on Puff. There is nobody else to go to for ROMS, for XF551 upgrades, etc, and I want those things. However, I do find it well within my rights to at least state what actually happened. If I have projected any opinions towards Bob Puff, then I apologize and I rebuke myself for doing so. I do feel it necessary to at least relate my story, and let others form their own opionions. If things didn't turn out this way, I wouldn't be typing up this situation, because I have **NOTHING** to gain from it, and quite a lot to lose....to the tune of a few hundred bucks, at the least. I'd say I handled the blow with a rather mild reaction, compared to others I know :)

Mike: If you just answer your customers (even with a "no") you'll never have any problems, and you'll certainly not have "to look foreword to <this> when operations shut down in the future."

James Wood

Thanks for the tips on purchasing disks - but I'm aware of the different formats and costs.

My question was a bit different, though. . .

High Density disks seemed to flake out very fast when used in an ATR8000, but I'm not sure if I'm going to have the same problem with double density disks.

To me, you HAVE to use high density in a 1.2m or 1.4m drive(s) -- but I have been using double density without any problems, other than once not being able to access ANY (out of 30) 3.5in disks..

Does the ATR only handle double density disks??

>NESFLASH: There are no COMMERCIAL software outfits left for the atari8

Wrong! There are actually several commercial vendors of software. Just
read AC or most club magazines, there are still little outfits
out there marketing NEW and improved 8bit software.

Just recently I bought a package called "Small Business Systems" from
Moonsoft, a one man software house. Needless to say, this was the BEST
peice of commerical software I had EVER purchased, including titles
for my PC Compat.

There are also folks out there still commercially marketing AtariWriter
Plus printer codes, upgrades and other such stuff..

If you look around, you'll find there are still commercial
entities hawking their wares.

>rather than serial that way.

Some years ago, somebody from Holland designed such a cable, which is in
fact very simple, and wrote a small driver for it. The data rate was almost
the same as reading from a standard 1050, but it had no seek delays so the
throughput was constant. The nice thing of the driver was that you could
save a program to the joystick port (with basic for example: SAVE"J:BLABLA")
and do a load on the other side!

Message-ID: <belitz.145.000E1C06@genesis.informatik.rwth-aachen.de>
Source record: 95265

```
Hello !!!

I hope, here is what you're looking for :

For the dynamic rams you need refresh, you know.
In the ATARI machines the refresh-controller is the Antic-Chip.
One refresh cycle means that the 6502 loses one machine cycle.
In most graphic modes the Antic does 9 refresh cycles per raster line.
This are (for PAL machines)
9x 312 (lines)x 50 (Hz) = 140400 per second.
Really there are a little bit more, because Antic generates some refresh
cycles during Vertical Blank too, but in comparison with the figure of
140400 you can forget them.

Now, the graphik time:
While Antic generates the picture, it must get the information from ram.
So it uses also cycle stealing.
The princip is, that per byte the Antic reads one cycle is lost.
But what you have to mention is the following.
In graphic 0 the Antic had to read first the 40 characters and then the
bitmap for the characters !
So, in GR.0 (and I believe also in GR.12 and GR.13) the Antic generates only
one refresh cycle per first Character raster line.

So here is an example (for PAL machines) :

cycles per

-Displaylist 1
-read character numbers 40
-read characterset 8x40
------------------------------------
361
24 lines per picture x 24
------------------------------------
8664
rest of Displaylist + 8
------------------------------------
50 (Hz) pictures per sec 50x8672
------------------------------------
cycles per second 433.400

refresh
24 character lines 24x1
288 other lines 288x9
------------------------------------
```

50 pictures 50x2616

130.800
So you will lose approximately 564.200 cycles per second with DMA (in Gr.0)
Player-Missle DMA needs approximately 64.000 cycles per second.
VBI needs something around 50.000 .

Hope I could help you

Matt

P.S. Figures are from P.Finzel "Die Hexenkueche" for Atari 400/800

James, he should have written you back. But the solution to your problem was to pay the $5 in long distance to call him up and tell him you have an emergency setting things up and that you are going to send the whole shebang to him. There is no way he would say no under the circumstances.

When it comes to Bob deciding who to help and what to charge, the first person he'll cut a lot of slack for is someone who has ordered stuff directly from him, like you. He was always courteous to me even before I ordered the Floppy Board from him, but certainly after ordering that and the backup software, and also after cashing my shareware donation I was put on his A list for service. You are definitely on his A list for free (or nearly free) service despite the false signals you got from unreplied snailmail.

To date, the only things I've paid for in service for his hardware has been a replacement power supply. All other replacement parts and labor has been FREE. There is nothing that makes me feel better than to send something off that was acting flaky and have him go over it and fix it knowing that I'm not going to pay a cent and that he knows his SHIT. He's very good at instantly diagnosing what's wrong with a piece of hardware and remedying it. As bad as it may seem to give up the hardware for a while and pay the shipping to send it back and forth, you can sleep well knowing that he's going to solve all your problems. I can't speak for others--maybe they tried getting things fixed and still had problems...

You assumed he wouldn't have helped since he didn't send back mail. Well, some people are just hard to reach by certain means. He runs a BBS but does he bother to answer feedback? Maybe once every 2 months if that. You just have to know how to reach him.

Ignorance is not bliss in the Atari8 domain. It's suicide. You have to learn those little things about the status of the 8-bit domain to prevent this kind of emotional trauma.

Having trouble setting up such complicated rigs is not uncommon. I spent hours cutting my teeth with the hard drive I bought. First off, I own one of the early BBs. These have a REVERSED SCSI port pinout. That slowed me down a bit until I recognized it. Then I didn't have the drive info for it and I had to call back the company I bought it from and get the specs for it. Luckily there weren't any jumpers to have to change. Once the info was plugged in and I waited out the long lowlevel formatting process I was all set. Then when I tried to plug in a modem I burnt out the UART because I plugged it in reversed. Sent it back to Puff and got that fixed, and while it was there, that is when he replaced the supply which was falling apart. I also made sure I ordered a printer cable so when it finally came back it worked perfectly. It didn't help that the previous

owner was a smoker by the way, and didn't own a 'case' for the BB.... The builtup grime on the BB is probably a big reason why it caused perpetual lockups after long usage. Vibration is also a big cause. But the parallel port and the cart ports are extremely sensitive on the Atari8. One spike can lock up the computer, unlike the relatively stable SIO ports. Hopefully if I replace a couple chips with higher speed equivalents as someone suggested on PRO!-net that might help reliability.

I got cheap floppy drives at a computer show. Like 17-20 for 360K drives and $50 or so for 1.44s. The cable was the problem with the floppies. Making sure stuff wasn't reversed, and physically STUFFING those drives into my narrow XT bays was a challenge. Luckily I didn't have to worry much about termination...

It's like this in any platform, especially with Clones. You almost have to learn how to be a hacker to get along. And with clones, their support involves a lot more expense and red tape than Puff's service policy.

You don't want to hear the travails of me trying to get an external IDE drive hooked up to my Amiga. If everyone got disillusioned about the platform from having to set up hardware, noone would be using computers anymore. That's why people actually PAY others to install hardware these days, because it can be such a pain in the ass.

> -bill!
> kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu Got a new .plan!
> William (Bill) Kendrick / | \ ** New Breed Software **

Hell. Those who order theirs now will probably get a slightly better product. They've almost run out of copies but are about to produce a second edition. This is because the first edition had a LOT of typographical errors. This in part due to the author's printer not printing the '<>' in listings (they came out as '[ ]'), a few incorrect page number references caused by the extensive editing they had to do in order to get it to fit into 400 pages, and the author's abismal spelling which had to be severely edited.

Still a damned fine product, though. Best 16 pounds I spent last year :-)
.
> Why isn't there a damned Mapping the PC? :)

Are you willing to write one, Bill? :-) Anyway, PC programmers aren't REAL programmers at all. Very few of them bother writing in Assembly language ... have you ever seen 80386 assembly? AAAAARGH!

Bill's msg pretty much defined why I am not one of his admirers. He is one of the Atarians who immediately jumped ship to the ST when it came out--and of course now the Clone world. I doubt he has touched an 8-bit since 1985.

To this date I have not been able to reconcile the reports that Jay Miner may actually have held a place for the 8-bit in his life after leaving Atari when I read a transcript from a Delphi conference in which he said he didn't know what MAC/65 or Action! was. Despite me owning an Amiga, that little ditty pissed me off.

I question the taste of anyone who made a clean jump from 8-bit to ST. I know I won't win any friends that way, because a lot of 8-bitters are in fact mostly ST-advocates with 8-bit nostalgia (like some of the guys I used to hang out with on Delphi) but that's just how I feel about it.

Bill always seemed to have hardware lust.

For instance, read page xxx of Bill's Introduction in Mapping the XL/XE:

"Do you wonder why we didn't try to move both bytes of H at one time, as we did in Basic Z+, above? Simpe: the 6502 microprocessor has _no way_ to move two bytes in a single instruction! Honest! (And this is probably its biggest failing as a CPU.)"

Note the exclamation points. The guy can't wait for something to come along that better suits his standards.

If you want another example quote from a guy who wrote at a time when he was involved in the 8-bit, but was having wet dreams of greener pastures, read the text file that accompanies the 'Hollywood Medieval' sound demo where he talks about the toil of working with Pokey and how he's so looking forward to the 'next big thing' in sound archetecture.

You know, either you like the platform, or you don't, and if you don't get out. I don't want to have the wining and the moaning about the 6502 and Pokey and what not.

Mere mortal William Kendrick provoked me by writing:
: How much software supports 1020's though? Most support EPSON, quite a few
: support, like, the XMM801, and some supports "Whatever it can, you supply
: the codes for it though."

Depends on what you want to use it for. The 1020 does have text modes,
it just has to WRITE them like someone writing with a pen so it isn't
fast. But it's a fun little thing to have around.

It has scaled fonts like a laser printer ;)

Speaking of shady deals, I don't know what Bob Woolley's involvement with I.C. was 3 years ago, but I tried getting in touch with them and failed. They were still advertizing I think, but the company was like alive and dead at the same time. I wanted to get the modification that hardwires your numeric keypad into your XL/XE (I still want that) so you wouldn't have to use any software handlers (which don't work with everything) and later I learned on GEnie that they were dead.

They had an area allocated on GEnie for them and everything.

I hate when companies fizzle without even making the proper arrangements. Whoever was in charge at that time was a real shithead for not handling the shutdown gracefully.

> 2) Have a hole on the left top (opposite side of the Write-Protection one)

Which brings up an idea/possible solution for James.

I just got an ATR8000, and as yet have done nothing with it, but
if you can use a 5 1/4 inch high density drive (1.2 meg) in it,
you _should_ be able to get a 3.5 inch 1.44 meg drive to work as
well. I have not even cracked open the manuals ... but presuming
the 1.2 meg drives and floppies work, here is my suggestion:

Some (or all??) 3.5 inch drives use the hole in the floppy casing
to sense the density, and change internal electroncis ... perhaps the speed??
You could experimentally try putting a piece of dark tape to block
the light thru that hole, and try again. I have had experience
with some mechanisms that (in combination with the specific
computer, perhaps) would not write a real 720K floppy without the
hole covered. Other older mechansisms ignore the hole altogether.

As mentioned above, for 720 K get the Double Density floppies,
without the hole. For 1.44 get the High Density floppies with the
hole, or (if you are brave) punch or drill a hole in a 720 K
floppy. These days that is hardly worth doing, though I bought a
punch to do it last year a Trenton. For five inch drives, Double
Density disks are good for 360 K in a 40 track drive, and 720 K in
a 1.2meg drive, while high density disks are good for the 1.2 meg
format only (I think there would be compatibility problems trying
to use them at 720K .. not enough write current for the magnetic
media) The difference (in modern times) is that the double
density disks have the hub reinforcing ring, while the high
density disks do not have a hub reiniforcing ring. As many here
probably know, older double density disks also did not have a
reiniforcing ring, either. Double density disks are also a bit
browner, high density ones a bit blacker (the media itself).

A 720k 3 1/2" mech is what DD disks were made for. HD are for 1.44 and 1.2
drives.

> : the comic-book for the Hulk game. An "X-Men" story was written and
> : published (in "Marvel Fanfare), but no game. Was there a "Spider-Man"
> : game in the series?

There was a Spider-Man game, and amazingly, I completed it! Other games in the series were The Incredible Hulk and the Fantastic Four (which as far as I know, was never released for the Atari, but I played it on the Spectrum). Spider-Man had graphics in certain locations, as did the Hulk.

The entire "Questprobe" Series was centred around somebody called "The Chief Examiner" whose home world was in danger from the "Black Squadron", and alien attack force heading to the planet to destroy it. Unable to defend themselves, the Examiner warped (?) to Earth to try and find some "Heroes" from which he could suck energy to enable him to build a robot to defend his planet. Marvel brought out a few comics to go alongside the series, but funnily enough, things never came to a conclusion until just last year in the QUASAR comic. But that's another story completely! :-)

Cheers, Ric.

: have been using double density without any problems, other than once not
: being able to access ANY (out of 30) 3.5in disks..
:

After time (and depending on floppy mech) "notched" 3.5's kicked
up to 1.4 will be destroyed.

First the heads on HD floppys are designed to put out a stronger
signal, and HD disks are designed to handle this because of the
magnetic coating they use. Using a LD floppy in a HD drive can cause
problems because the data "leaks" easier into adjacent tracks.

There are other reasons not to do this.. but this is just one.

I have an Atari 800 with 48k (Atari memory) along with a Atari disk drive w/ "happy' modification and additional drive (not Atari - I think it was some type of double density drive?). A bunch of carts and hundreds of disks, Atari trackball, monitor cable,2 joysticks, etc... All is in great working condition and is presently boxed up (I haven't used it in quite a few years).

Let me know what's it's worth to you.

Ken

Mere mortal William Kendrick provoked me by writing:
: Ok, I can't believe I missed that post of Glenn's ("no commercial dealers").
: Damnit, Glenn... get five bucks and get a copy of the Omnibus! Why, right
: in the back for just $50 is ChromaCAD (3-D Model Builder, Surface Shader,
: Printer and Mover Utilities)!

Is that still being ACTIVELY developed? I've got it, but I really found it so inconvenient to use I gave up on it. There is a difference from recent software (like a few years old) and a programmer who is actively supporting it (i.e. working on revisions, more features, or more titles).

If people want to write about these commercial programs, please do. You know, I haven't got the initiative to go out and get things like the Omnibus; it all seems so pointless when we've got the internet here. It's our duty to inform and not just bicker.

I've seen the company FAQ go by, but nothing struck me as being particularly "new".

It's like, in the Amiga world, there was a lot of whining about there not having been any PCMCIA modem handlers written for the A1200/600. After a while, someone said 'fuck it, I'll write it, I'll get back to you when I'm done' and now he's done with a commercial product which fills a void caused by the lack of support from C=. The same thing happened with a driver for the new outstanding Epson Color Stylus printer. It's nice that although the house is crumbling in that world, there are still a shitload of programmers out there to pick up the slack and make a buck doing it. That's the attitude to have. Stagnance = death.

I don't see too much of this entrepreneurship in the 8-bit software 'biz'. Are any programmers trying to write a Fax package? What about 24-pin or inkjet Daisydot-like programs?

It was the dead end that I saw in the 8-bit modernization/development scene that hastened my redefinition of the 8-bit to one of the hobby computer. I would have paid for programs like that if they were around. Some of the software which got fairly good reviews, like Turbo File and ChromaCad, did not impress me with their ease of use.

It's pretty clear to me that things are worse than 3 years ago. If FTE delivers everything I've heard about and CSS gets the R:P: out I'll feel a little better about things, but we're definitely in the worst lull ever. And we all know that hardware alone won't be enough to keep the 8-bit viable.

Message-ID: <9501250108.AA11501@zippy.sonoma.EDU>
Source record: 95297

Well, my SIO2PC was tested and it works perfectly, so either something ghostly is haunting my computers in my room or my 1200XL is really dead. If it's my POKEY, then that sorta sucks because I've replaced it once before! (I'm pretty sure it was my POKEY I replaced; whichever one isn't wired in to a RAMboXL)

Anyway, I'm not interested in:

Atari 800XL or compatible (ie, 800XL, 600XL, 1200XL with 800XL OS, etc.) 64K or better than 256K preferred. (If it's 64K I can probably hook it up to my RAMboXL from within my broken computer. If it's bigger than 256K, I'll be pretty happy because I'd prefer more RAM! <greedy!>)

I don't think I could live with a 65XE or 130XE, and would also like a PBI if I can get one, but it's no biggy (with MIO II and R:P:Connection coming.. some day.. I hope!).

Soooooooo... even if you've replied to me about this before, tell me what you've got again because I'm actually SERIOUS now. :)

Thanx!

I don't understand why you have such a total aversion to any computer that is not an Atari 8-bit. I owned several 8-bits from 1982 through 1986, and since then have had to more complete systems (kept the first new setup for about a year, then sold it, and now have another one in the closet await space to actually set it up).

But in late 1986 I saw that the 8-bit was a dying platform, and I needed something more powerful. So I went to the ST. I used it for five years, until the end of 1991, when, after nine delays of the Falcon computer, bailed and went to the Amiga. There I stayed for a year (wondering why in the hell I'd even bothered with an ST), when I finally had to move to the PC myself.

The only machine I have any regrets of getting rid of was my Amiga. I miss it dearly, but realistically, the PC is the future. It's also where the money is. I have a job that pays very good money to work on PC's. So I cannot question my move at all.

Before I got my ST, I swore I'd find a way to keep the 8-bit as well. But I just couldn't afford to keep an old affection around when it could be sold for good money to be put toward something far more useful. At the time, the 8-bit was worth as much as it was going to be, since it was still a fairly mainstream machine (if an Atari of any type could ever have been called mainstream).

Ditto the ST. When I sold my MegaSTE in early 1992 after buying an Amiga 1200, I got a decent price for it, becasue they were still in demand. The prices hadn't started going through the floor like they did when the F030 finally came out (and promptly died as well).

I still have an 8-bit system. IN fact, it's far superior to any previous 8-bit system I've ever had. It's a cool machine. It was the best thing around for many years, and next to the Amiga, the most innovative computer ever made. But I have better things to do that try to use one as an everyday machine.

I've always enjoyed reading Bill Wilkinson's stuff, and he's one of my favorites. Just because he moved onto more profitable things doesn't mean he's a traitor. It means he has some common sense.

It's pretty complete, but the files starting with "A" are missing.
I had fun going through the directory trying to figure out the 6.3
file names... The files lc1.arc through lc4.arc have catalogs. Those
made things easy.

Found some Antic/ANALOG files not seen on GEnie. I remember picking
over CIS' directories with a 300 baud modem 5 years ago. FTP is sure
cheaper....

I also am also daunted by the fact that most Atari 8-bit vendors are not participants in the telecommunications arena. Here's my personal tally of who's on and who's not.

American TechnaVision - No
Atari Classics - Jim Hood has a GEnie address, though he rarely participates
B&C ComputerVisions - No
Best Electronics - No
Branch Always - GEnie, CompuServe, csa8 sometimes, responds to email
Computer Software Services - CompuServe, responds to email
Current Notes - GEnie, CompuServe, FidoNet, csa8, responds to email
Fine Tooned Engineering - GEnie, csa8, responds to email
San Jose Computers - No
Toad - Has Internet Addresses, rarely participates on GEnie 8-bit side, responds to email

This is going to be a bit vague, but my memory isn't quite what it once was :-)

I'm looking for a game I last played back around 1985/86. As I recall, it was a German game with you controlling a character around a vampire's castle (could have been Dracula). The game itself was a platform game which scrolled in all 8 directions (or did it flip?) and you had to find and light the candles on each level, while avoiding bats and other nasties.

Even by today's high standards (see Polish software if you wonder what I'm on about), the graphics were neat and the gameplay had that 'one more go' feel about it.

Anyone have a clue what I'm talking about? Oh yes ... it was disk only.

Actually the PC documentation isn't that bad, it just isn't sold/thrown in with every computer so it isn't as well known as the Atari OS. IBM published the BIOS source code for the PC with full comments. A friends father in law was a mid-high level IBM employee. When he retired from IBM S.J. to Oregon he gave all his docs & computer to my friend. Really the BIOS is most of what we consider an OS & I believe the entire system resides in an 8k EPROM, but I'd have to check. <Ha Ha! a measly 8k OS while we have a full 12k!>. Some of the things that make it small, it has device independance like the Atari. It doesn't even contain a character set, the character set is a part of whatever video card you have plugged in. For that matter, if you wanted to use an Atari character set (Why? I don't know) all you'd have to do is grab an old video card & put in a new Eprom with the Atari character set. The orignal PC would actually boot up to Basic in ROM just like an Atari. Several people were suprised at the similarities between the IBM BIOS & the Atari. They have something equivalent to device control blocks, vectors in ram that are loaded from ROM that you can redirect to your own routines. The only real difference I could tell if I wasn't my usual nit-picking self is due to processor differences. Where we would set up a DCB & jump through CIOV, they would do something like INT 13 which invokes the equivalent of a JSR to a vector. They also expect whatever card is plugged in to be smart. For instance, when we go to CIOV to a disk access, we don't care if it's a 810, 1050, Indus, ... Ditto for the IBM when it invokes INT 13. It doesn't care what kind of floppy controller chip is used, if the card has it's own BIOS routines on it, nada. It expects the same type of device independance as we enjoy. Anybody remember holding down the <OPTION-START> keys to get the 1030 to load it's built in term program? Or leaving an 850 online with the disk drives turned off & having it automatically load the RS232 handler? IBM does the same thing except the smarts are loaded from the cards. The two systems couldn't be any farther apart from a hardware stand point, but from a general theory of design it looks like they read De Re Atari before designing the BIOS.
Rick

573. Re: Bill Wilkinson responds

Glenn Saunders (krishna@primenet.com) wrote:

: Bill's msg pretty much defined why I am not one of his admirers. He is
: one of the Atarians who immediately jumped ship to the ST when it came
: out--and of course now the Clone world. I doubt he has touched an 8-bit
: since 1985.

You are a real asshole! I mean just because he has moved to a differnt
platform doesnt mean he is bad or anything. The Atari 8-bit club here in
St. Louis is no longer to be found, they moved to ST's and then to PC's.
Its called progress my friend, you dont seem to know nothing about this.

I used to own an Atari 800xl and 130XE and went PC in 1992 and sold my
Atari 8-bit to the kids across the street. Now I use the Xformer
Emulator to use the old stuff on the new platform. Now I guess I am a
against the Atari 8-bit platform because I moved on to other things.

: To this date I have not been able to reconcile the reports that Jay Miner
: may actually have held a place for the 8-bit in his life after leaving
: Atari when I read a transcript from a Delphi conference in which he
: said he didn't know what MAC/65 or Action! was. Despite me owning an
: Amiga, that little ditty pissed me off.

Wow you really must be a winner, you own an Amiga, I guess that makes you
special! Duh!

: I question the taste of anyone who made a clean jump from 8-bit to ST. I
: know I won't win any friends that way, because a lot of 8-bitters are in
: fact mostly ST-advocates with 8-bit nostalgia (like some of the guys I
: used to hang out with on Delphi) but that's just how I feel about it.

Like anyone gives a damn about you! Wow! gee you must have a lot of
friends who care about you. With that attitude I can see why you dont
have any friends.

: Bill always seemed to have hardware lust.

I guess you are jealous because you cant afford anything but a $75
Amiga. Wow I feel so sorry for you.

: For instance, read page xxx of Bill's Introduction in Mapping the XL/XE:

: "Do you wonder why we didn't try to move both bytes of H at one
: time, as we did in Basic Z+, above? Simpe: the 6502 microprocessor has
: _no way_ to move two bytes in a single instruction! Honest! (And this is
: probably its biggest failing as a CPU.)"

: Note the exclamation points. The guy can't wait for something to come
: along that better suits his standards.

Its called progress! There are always disadvantages to any platform,
learn to live with it and move on!

: If you want another example quote from a guy who wrote at a time when he
: was involved in the 8-bit, but was having wet dreams of greener pastures,
: read the text file that accompanies the 'Hollywood Medieval' sound demo
: where he talks about the toil of working with Pokey and how he's so
: looking forward to the 'next big thing' in sound archetecture.

Like the Sound Blaster AWE-32! I have one they are awesome!

: You know, either you like the platform, or you don't, and if you don't
: get out. I don't want to have the wining and the moaning about the 6502
: and Pokey and what not.

I like the Atari 8-bit, yet I moved on! So do most people!

You are a loser! Get a life and a computer!

Mere mortal James Wood provoked me by writing:
: GRAB THE BALL AND RUN WITH IT, MIKE!! PUT A HIGH-SPEED SERIAL
: PORT ON THAT MIO II AND CREAT THE "END-ALL-BE-ALL MOTHER OF 8-BIT
: ADD-ONS." I can taste it now.....

A high speed SIO interface has unique advantages. For instance, what about a MUX chain of several 1200XLs without having to add PBIs to them for high speed serial on each slave, nor having to pay for the additional hard drive interface circuitry when you don't need it.

No, the R:P: has a definite place in the 8-bit world. My first 8-bit was the 1200XL. With a regular XL/XE OS and Basic hack, and with Supervideo XL, it's by far the nicest 64KXL. But the PBI hack is not an easy feat, therefore it is the ideal MUX slave.

I still feel the 1200XL keyboard is the best keyboard of any keyboard I've ever used, except maybe the Atari 800.

After you get carpal tunnel from working on even the spring type XE keyboard, you learn to appreciate the importance of a good keyboard on your chosen main 8-bit... I have yet to find even an IBM keyboard which compares to the 1200XL (i.e. Transkey). The 1200XL has oh such a subtle touch, smooth as silk. It's a shame when it is locked out of stuff by not having a PBI.

A few months ago, I was in the middle of a heated Donkey Kong episode, when my 800XL went tits-up.

I was running along the conveyor belt (in the "mudpie factory" level) when the screen rolled a little bit, and then scrambled and locked up. Naturally, I turned the power off, and when I turned it back on, the screen was black for a second, and then immediately went in to the "memory test" screen. In testing the ROMs (the first two BIG bars that it draws) the first one is RED!!!!!

Does that mean I have a ROM problem, or could it be something else (RAM) that makes it look that way to the memory test?

Does anybody know where to get an 800XL fixed? Seems like I may as well throw it away....It would cost so much in labor, and shipping too. Trouble is that I don't have anything, then, with over 64K!!

I have a 130XE that's stock...but the cart port doesn't work. Any ideas about this? Is it a common failure?

James

Well, Bob Woolley just popped a coupla EPROMS into the OS sockets and it has a RAMboXL 256K RAM upgrade. Also, he hooked the EPROMs up to the Channel2/3 switch and now all it does is select 800/800XL OS. That and the OS itself are the coolest parts of it. He claimed better video, but IMO it sucked compared to my stock 1200XL. Maybe my original was better than most? Maybe his fix was more for color saturation rather than video clarity.

Anyway.. I've yet again got to run! Bye!

-bill

Wasn't that the pin that should have 12 Volts on it? If I remember correctly
the 1200XL either misses the 12 Volt or the 5 Volt output on the SIO port.
(That's why there was this special version of the MPP interface (the regular
version was called MPP 1150 and the 1200XL version was called 1151).

When I had problems with my deluxe upgraded XF (under certain curcumstances, a sector was written 52 tracks closer to the inside than it should have been), for some reason, the problem doesn't occure when I use the BB&FB, Bob send me a new EPROM, free of charge.

When I got my BB&FB, I connected the wrong wires to the wrong voltages (Bob didn't tell me he'd switch wires on the 110V/60Hz power supply and when I impatiently connected the wires to an switching power supply, I erased part of the EPROM). Bob could have told me this was all my fault, but he didn't. I called him to ask if he could leave me a file containing the burnfile on his BBS. I picked it up an hour later and sent it to the Bo Schreurs, who acts as a CSS Dealer here in the Netherlands. His brother, who had picked up my BB/FB combo before I called Bob, was still on his way home when Bo received the file.

: Having trouble setting up such complicated rigs is not uncommon. I spent
: hours cutting my teeth with the hard drive I bought. First off, I own one
: of the early BBs. These have a REVERSED SCSI port pinout. That slowed me

: I was all set. Then when I tried to plug in a modem I burnt out the UART
: because I plugged it in reversed. Sent it back to Puff and got that

: lockups after long usage. Vibration is also a big cause. But the
: parallel port and the cart ports are extremely sensitive on the Atari8.
: One spike can lock up the computer, unlike the relatively stable SIO
: ports. Hopefully if I replace a couple chips with higher speed
: equivalents as someone suggested on PRO!-net that might help
: reliability.

That's a fundamental with synchronous I/O ports - they panic if they lose
the clock signal, or if it hiccups. Asynchronous I/O (like the SIO) is
less efficient, but it's more bulletproof.

: and $50 or so for 1.44s. The cable was the problem with the floppies.
: Making sure stuff wasn't reversed, and physically STUFFING those drives

It sounds like the majority of those problems could have been completely
avoided by using keyed connectors and cables (Which is pretty much
standard nowadays) - which can only fit in the proper direction. I'm
still kindof puzzled by how it is possible to reverse a DB-25 or DB-9
connector for a modem (???) That sounds kindof odd... Do the BB's use
all proprietary connectors or something?

Great! Care to modify mine? ;)

>What about the 800XL? I'd take that over an 800 most of the time. So
>many useful things need at least an XL to work.

Well,since I have all the 8-bits excepting the unreleaed 1400XL,
1400XLD, etc., I'd use the 130XE intead of the 800XL, as I don't know of
any program that won't run on the 130XE but WILL run on the 800XL. But,
that's more a function of my situation than anything else. I don't
have anything against the 800XL's...I used one for a while, before
I got the 130XE.

This makes me think of something I have been wonderin about for
a while now. Was the 600Xl a big seller? I know the 400 was, because
when it was released having a low-end computer made economic sense. But
by the time the 600XL came out, the TI/C=/Atari price wars had brought
the price of a 64K computer down to a much more manageable level.
I've only encountered one 600XL in the second-hand market (ie, garage
sales, flea markets, etc.). (That's the one I own,of course. [Grin]).

590. Atari 8-bit to PC request

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-26 01:49:23 UTC
From: siano@cceb.med.upenn.edu
Message-ID: <3g6v33$efg@netnews.upenn.edu>
Source record: 95233

The story's simple. UI've got an old Atari 800 in my closet,
with an 810 and 1050 disk drive, one of those old interface boxes,
maybe even one of those tiny modems that sold, and a lot of floppies
with old text files and games and stuff.

Here's my problem. I've been an IBm user for years now, and
I'd really like to get all of my old text files into my MS-DOS system.
I _could_ try doing things like null-modeming, or FTPing a conversion
package, or whatever.

But my technical know-how is pretty limited. Frankly, unless
there's some way of plugging an 810 disk drive into my IBM, and simply
copying the files that way, I really can't access a lot of writing I'd
really like to resurrect.

So, here's what I was thinking. I've got this old system that
some people here might be interested in. I'm seriously considering
offering the system to anyone who can make the transfer quick and
painless. This isn't a firm offer, but I'm considering it.

Note: I've forgotten what's on the old disks, so there might
be semi-private stuff there. Also, if ayone knows of a way to get an
IBM to read an old 810-formatted floppy, please let me know.

Hmmm. I'd wondered about the size of the IBM PC Bios. Of course,
these days the BIOS includes more stuff,including bells & whistles like
autodetecting IDE drive type. Not a bad job of programing on IBM's part
(or whoever developed it for them, considering that they farmed almost
the entire PC development process outside the company (albeit in bits
and pieces)).

>the RS232 handler? IBM does the same thing except the smarts are loaded
>from the cards. The two systems couldn't be any farther apart from a hardware

>De Re Atari before designing the BIOS.

Hehe. Now THAT would be funny, if it were true. :)

How about this: They actually simply copied and modified Atari's
OS source code. ;)

Hmm, not sure, you might want to call the company and try to get
a catalog. They are a surplus place that gets LOT of neat things in. One
of the things i had bought from them was a pocket-sized terminal with
built in 300 baud modem, and accoustic couplers to use on payphones.
yeah, i agree, cheesy, but it was one of those spur of the moment things
i had to have. :)

this NUTS and VOLTS magazine, for folks who dont know, is just a
big dealership magazine, and has ALOT of neat goodies in it. heres a
couple other stuff for the atari they have in this issue...

ATARI super sketch pad and pait card. $12ppd. for our atari and
other systems flyer send #10 SASE: more than games, 8207 brianwood lane,
austin TX 78757-7642.

ATARI 800/XL/XE software catalog. send for your systems free
catalog to Lotsa Bytes, Box 1756, winton CA 95388.

theres some more in some back issues, but im too lazy to drag em
out and look. :) when nexts months issue comes out ill post all the atari
stuff in it i see.

Some may recognize my name as a former Atari 8-bit die-hard.
Back in those days I collected a lot of Atari stuff. Recently
my closets became full so I decided to do some cleaning. I still
have many fond memories of my Atari days...I loved that machine...
so I want to keep almost all of my Atari stuff. But to keep a
New Years Resolution promise to myself to clean out some of my old junk,
I'll put the following few things up for bidding:

1 Atari 400, 32k, in original box with all papers

1 Atari 800, 48k

1 800xl (brand new; box was opened & machine tested that it worked,
then box taped shut again and stored away in closet)

1 1050 drive (was my #4 drive, and so was *only* used during playing
of Alternate Reality - The Dungeon :-)

-Ray

PS - speaking of AR, I know Phil Price was on here a couple of years
back and I e-mailed him about the AR source code, which he said
he would make available to anyone who wanted it, in the near future.
Then I fell out of touch with all things Atari 8-bit. Did Phil
come through? Is Phil still lurking about?

PPS- Are people like, say, Bob Puff and Jeff Potter still out there
helping to keep the 8-bit torch burning? As I sit here digging
up old Atari memories I'm getting a serious itch to boot up and
play AR, Jumpman Jr, Donkey Kong, Whirlynurd, AstroChase, Preppie,
Drol..... :-(

I'd heard (rumour and innuendo mostly) that IBM considered taking the
Atari 8-bit for its own, repackaging it as "Big Blue". Does anyone know the
origin of this tale, its truth (or lack thereof) and any other juicy tidbits?

No, you CAN get access to the other 3 buttons on a Sega Masters/Genesis controller. [C] is easy.. it's just one of the paddles (high/low.. I forget which means "pressed" though! :) Just experiment). [A] and [Start] are a bit harder though.. it's been done (and described here at one time).

Oh, and duh, [B] is the normal fire-button for those who didn't figure that out :)

Sounds like it has defintily been diddled, but how now one can tell without
looking at the innards. The two 9 pin ribbon cables are identical to the
ribbon connectors used to connect the joystick ports (3&4) to a Corvus Hard
Drive interface, but as I say those are connected to the joystick ports.
Hmmm... Coincidence? The power supply for the 800 has the following specs.
9 V AC 15.3 VA (1.7A) Atari #CO14319 Transformer
(From the FAQ)

How can I get ahold of Bob? This mod sounds interesting! How much would you want for yours and what is your estimate of the problemns it has, what's it doing? Using the channel select swithch was a cute idea, he must have done more than pop a few eproms in though! Wonder what mods he did to the OS board? I know that a similar thing can be done with the Ramrod board for my 800 (2 OS's on one board) and there is more to it than adding the eproms (adding a 5K resistor between pin 18 (+5v) on each eprom and connecting them to a toggle switch, commoning pins 26,27,28, etc...) Hmmm... I wonder... Anyone know where I can get an 800xl os on a 2764 eprom?

605. HyperIt! Reviews! :)

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-26 07:05:56 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3g7hkk$2li@nic-nac.CSU.net>
Source record: 95243

I'm happy! :) All of the responses I've gotten about HyperIt! have been positive. The only complaints so far (and I've gotten like 3 of them in one day :)) were about the pointer control (it goes too fast/slow depending on what the computer's doing. I think some of the mouse pointer routine is going to finally have to be turned into a VBI. No prob. (he says, unaware of some bug which will haunt him for a month once he alters his code! :))).

Anyway.. I'll be getting replacement XL soon and my (NOT-broken) SIO2PC cable back (thanx again Rick!) and will be able to FINALLY work on it again (as well as a ton of other things I feel like making, including Geneocide, although I'm sure a few other projects will get out before it, since it needs REAL-LIFE WORK DONE (like, video taping and video capturing and stuff!)).

I still of course and offering a copy of v.0.4 beta to anyone who'd like to test it. It requires MyDOS 4.53 at the moment (it CAN run in 4.50 but it acts up I've heard, and it will (when released) run in SpartaDOS (I hope)). A joystick is optional, as are fast drives (Hard Drive or RAMdisk). It's being written in Action! but does not require it. It also comes with three example stacks, a short document on what the commands are for making stacks, and I (unless I forget) try to send a copy of a small "How to Make a Stack" text file to everyone I send beta copies to. (Anyone who didn't get it, just e-mail me and I'll forward you one. :)).

"Reviews" I've had on it range from "GREAT idea" to 'cool, we need this' to emphasis on the great use it will be for making interactive documents to "add HTML support!" and of course the pointer speed flaw. :)

Well.. just thought I'd be egotistical and talk about myself and my cool software! Thanx for bothering to read it! (hehe)

Thanks very much, that was exactly the sort of thing I was looking for.
I had some figures for the NTSC/EIA machines, but nothing for the CCIR/
PAL stuff (It would be nice to provide a S/W switch that enabled the
emulator to run in both modes).

Now all I've got to do is figure out on precisely which cycle all this
happens :(

From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <AB0C9BE35F5@east-01.novell.leeds.ac.uk>
Source record: 95251

I'd also like the pinouts etc for the ST Xformer cable. Would the
person who said he has them please either put them up on the digest
and/or e-mail me a personnal copy (chmrig@leeds.ac.uk). Thanks.
Also I assume I need some sort software on both the ST and 8-bit side.
What do I need and where can I get it?
Does anybody know of anybody who sells these things ready made with
the necessary software?

I would just like to add my thoughts to the statement;
'There are no commercial software developers left', basically its
not true. There are several in Europe; ANG, KE-Soft and PPP to name
a few and they are still ACTIVELY creating NEW software. I myself
sell 8-bit software as well as developing and assisting in the
development of new software. For me it is strictly part time and very
much a hobby, but I do release new commercial software as well as
re-releases of older titles when I can. I also have an e-mail account,
and regularly post to csa8 and reply to e-mail messages anybody sends
me. If my experiences are anything to go by its simply not worth most
vendors paying for e-mail etc access because the response from
prospective purchasers is usually pretty poor, unless they can get
free e-mail (via work or university etc) the economics are against
them.

If anybody is interested in what I have to sell, just let me know and
I'll e-mail you a complete list (about 60, 80 column lines of text).

613. Black Moon Systems/Moonsoft

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-26 15:05:38 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2F27BA3B@POST0.LAAFB.AF.MIL>
Source record: 95253

Both Black Moon Systems and Moonsoft are correct names. One is the name of the " whole company." The other is the name of the software part of the company, so to speak. Ben Martnick owns Black Moon/Moonsoft. Current Notes ran a review of Small Business Systems about a year and a half ago. That was the last time I spoke to Ben. I believe Michael Current copied the information for his list from that review.

As a side note, the "problem" with Michael's vendor list is that there is no organized process for validating the data in it. It's all ad hoc. I tried to set up an orderly process to validate a vendor list with the old Atari Classics a while back and failed. My approach was to put a name and date by each entry as to when the information was last validated and convince people to check each address/phone on a periodic basis. I published the results in my Current Notes column (where Michael copied much of his list). It was very hard to get people to "validate" in an organized fashion.

Dave Paterson took a different approach in his "Omnibus." He tried to validate a list himself.

Anyway, I applaud Michael for being persistent in his vendor list and FAQ. I do think there needs to be an organized process for validation, though.

: : factory, it was also the flimsiest with the worst keyboard feel.

: I would venture to suggest that those 130XEs with the Mitsumi (56-3217),
: single-layer Mylar XE keyboard are not bad at all. I find the tactile
: feedback, though not up to 800 or 1200XL standards is really quite
: adequate. No where near the same mushiness as the Sugiyama (FKJ0201131)
: double-layer Mylar XE keyboard. At least I was pleasantly surprised!

: I tried the XE Touch upgrade for the Sugiyama keyboard, but found it less
: than impressive. The keys felt too stiff for me.

I originally had a double-layer mylar keyboard which I hated.. But the TT-
Touch, from BEST Electronics (not "XE touch") really is a bit stiff, but
is incomparable to the original, and really is the best way to go if you
can't find the Mitsumi keyboard. I really like the chunky feel (there's no
doubt as to whether or not the keypress actually registered).It's also better
than the 800XL IMO.
Actually, some 800XL's have a different keyboard (keys are all flat on one
plane rather than like stairs), which is *quite* phriendly. Hard to find,
though.

There has been some talk about putting the past articles in Current Notes (CN) into a softcopy archive. Our publisher, Joe Waters has thought about this and at one time it was his goal to do just that. I'm not sure what the current plans are, but I will check with him or perhaps I can get him to respond here directly to the newsgroup with the current plan. Joe can be reached electronically at: joe.waters@genie.geis.com

If there is something in particular someone has in mind, please let him know. CN "allows" republication of articles if one asks and cites them properly.

> all proprietary connectors or something?

I agree that keyed connectors should be the de-facto. However,
the BB *does* use "nonstandard" connectors. The serial and parallel are
"edgecard" connectors with a flat plug. A proprietary ribbon cable
converts this to a DB-x connector. Getting it backwards is a real
possibility, and the BB docs, if memory serves, do not address this
issue. However, a moment of careful study and you might be able to
figure it out. I figure the BB is for a technically-oriented market that
might know, but it wouldn't hurt to warn the user more blatantly.

The floppy drive connector is also "edgecard" type, but it's
moreless the standard 34-pin that the old 5 1/4" PC drives use. I've
plugged those in backward on many a PC without lasting ill effects.

I'll post this to the group because I'm not sure.
(R. Gore asks what the .xmo extender is on CIS files.)
I think it just means it is a binary file and should be downloaded with
xmodem, many years ago before Kermit, Zmodem, Ymodem etc. The only
thing you should probably know is that xmodem, at least some downloads
of xmodem, can tack a 100 or so bytes on the end of the file, which can
sometimes mess up when you try to run/ unarc, etc.

(about the vendor list.)
I use it regularly. But, I keep in mind that there are vendors that really don't do/have much (the ones that just have some very old titles and not much else.), there are defunct vendors (these would require the validation that Reaser talked about), there are 'specialty' vendors (ones that only sell a few particular items they produce.) and then there are the large ones like Best, B & C, American Technavision that most people will have good luck trying to get stuff, then there are the producer types like FTe and CSS (I think those two are basically the only two that produce hardware and FTe software that is really in demand). What I'm trying to say is that the vendor list, it is helpful if you already know something about the vendors in the list. I've called many places in a list just to waste my telephone money on defunct or very limited places of business.

>Now all I've got to do is figure out on precisely which cycle all this
>happens :(

Actually, it isn't that difficult. Just figure how much data a mode will use and then figure when it will need to fetch it.

Example:

Mode 8 (320x200x1 bit) needs 1 byte every 8 pixels, or every 4 color clocks, or every 2 machine cycles starting with a fetch at the 1st pixel of every row.

I am getting really tired of bickering going on in this group over people moving to other platforms. Precious few people can live in a world of constant progress and not want to take some part in it, futhermore, noone gets rich doing 8-bit development, so if computers are ANY part of your work, you MUST move on. This group is for people who have an interest in the Atari 8-bit computer, PERIOD. Not for some elite group who has never touched another platform. For me, it took using other platforms to make me realize how much fun the 8-bit can be, but I'd hate to have my status as an 8-bitter dropped because I can't do EVERYTHING on that one machine. If I owned a Model-T, should I be kicked out of some car club for driving something else to work?

This group is for those who never left, those who have returned, and those who just want information. If you're someone who's been in this group forever, try to be a better host!

.XMO was the extension often used in transfering files to
Compuserve via Xmodem. Gnerally, it was used to indicate that the
may (or may not) contain binary information, and that they could
not be read on a terminal, but only downloaded. So.. they could
be any type of binary file, depending on the specific instance.

Rob, I did not miss your point. At the risk of getting in a childish, "I got you last!" exchange: It was a reference to your "I don't care..." statement.
In a lighter note, I've always wondered what Mrs. Atila the Hun would say in an interview.
Reporter, "Well Mrs. Hun, what do you have to say now that your husband has laid waste to the entire continent of Asia and is storming the gates of Rome?"
Mrs. Hun, "We're going to Disneyland! Sure Mr. Hun has slaughtered countless thousands of people, but he's a good provider & is really good with the children!"
If your a Hun, Attila is the greatest thing since sliced bread. If you're of European descent as I suspect you and I both are, your taught he was "The Scourge of God". I'd still suggest talking to a software developer just to round out your perspective. You're certainly welcome to disaggree with their point of view & they do have one.
Just to remind people, it wasn't that long ago that Zybex made it on to BBS's. I remember Bill Kendrick saying what a great game it was & how he couldn't believe something this great was in the PD. Sure enough, it wasn't. Turned out the pirated copies made it up to BBS's before the game was even in commercial distribution. At least that's what it seemed like. Bill had to tell every place that had a copy to delete it. I was flipping through a B&C catalogue & sure enough, it's there. I'm not saying B&C wouldn't have had to move to smaller digs anyway, but a few more sales of the game certainly couldn't have hurt. May be if you could get the author of Zybex to say something in the affimative about CCS's product line I'd be a little more open to canonizing Puff.
I've already used Webster's for shady => "of questionable merit" now here's subjective as I'm using it subjectivism=> "a doctrine that the individual feeling isor apprehension is the ultimate criterion of the good & the right"
Well with a few typos, but you get my drift. I'm ![commercial software developer, hardware manufacturer, pirate, vendor, consumer worring about his copy protected software going bad]. I'm not a fan of high prices for cable tv either, but I don't own an illegal descrambler. I think about getting one<g>. Would you aggree that this is considered a shady business? Understand in all their advertisments they emphasize that these descramblers or only to be used as decoders for channels you are entitled to recieve. I'm sure if I were sitting home right now watching free HBO I'd think the guy who designed the descramber was a genius! But... that still doesn't change the nature of his business.
Man, I'm spending way to much time in a thread I don't really care about. I'm out'a here. I hope we can have more productive conversations in other threads, but this is a total waste of time. Go ahead & take another shot

if you feel like it. But I give up.
Rick

Ben, I'm really sorry I lost the text file for it, but Wooley did u/l
a text file on how to do the mod. It is easier then you could imagine!
With the 1200xl, Atari put the traces on the mother board so you could
either use a 24 pin ROM or a 28 pin EPROM. To go 800xl OS, you just have
to get a MMU chip from an 800xl or buy one from B&C. You desolder the
two existing chips, put in the EPROM, & move 4 or so jumpers. That's it.
I'm not sure if I kludged it together or if it was described in the u/l,
but I used two piggybacked 128k EPROMS with the !CS pins bent out & going
to a switch where the former channel 3-4 switch used to be so I could
switch between OS. He does include the text for putting built in basic
& I have rev C in mine. Since 1200 has 2-8k roms vs the 128k rom of the
800xls, you use the extra socket for basic. You do have to run at least
jumper for basic. The only drawbacks are the function keys only work if
you have an 800xl OS vs something like Omniview, no PBI, cart slot on
a 1200 is, as I'm sure you know, a little tight for running things like
SDX or a Proburner. If you do a 1 meg upgrade, you lose basic anyway &
I don't own any PBI stuff that I haven't made myself, & for that I keep
an 800xl around. If you own a soldering iron & have $20 or so to transfer
to B&C, I'd really say go for it.
Rick

627. MASSIVE AUCTION VII -- Update #1 (Atari section)

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-26 19:22:44 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3g8sq4$jc@usenet.INS.CWRU.Edu>
Source record: 95169

```
Atari Section: UPDATE #1
-------------------------
MASSIVE AUCTION VII -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!
-------------------------------------------------------------------------

Starting with this auction I have divided the file into two parts, Atari, and
Non-Atari. The files are still rather large, so if you don't like large
files, and/or auctions, PLEASE stop reading now. You have been warned!

-------------------------------------------------------------------------
Games and/or game systems included in this auction are:

ATARI 2600 games and systems ATARI 5200 games and systems
ATARI 7800 games ATARI LYNX games
ATARI 8-bit computer games ATARI 8-bit computer systems

-------------------------------------------------------------------------
NOTE: If you have a trade list and/or want list, please send it. -- MJN
-------------------------------------------------------------------------

I will post updates approximately every 24 to 30 hours, and then delete the
last update after I'm sure the new one is accessible. I will also e-mail
the list to all bidders, and anyone who requests to be placed on the auction
e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

************************************

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

************************************

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, FEBRUARY 3RD.

2) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.
-- YES, THIS USED TO BE RULE #9. I'M NOT KIDDING!

3) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO
PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #2)
```

4) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

5) BUYER PAYS ALL SHIPPING COSTS.

6) BUYER HAS TEN (10) DAYS TO SEND PAYMENT.

7) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

8) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN PRIORITY (UNLESS THE TRADE OFFER OVERWHELMS ME). I COLLECT FOR OVER 45 DIFFERENT SYSTEMS, PLEASE FEEL FREE TO SEND ME A TRADE LIST.

9) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

10) IN CASE OF TIES, FIRST BID RECEIVED WINS.

11) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER, DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH (MY BANK IS VERY PICKY, BUT THE U.S. POST OFFICE WILL CASH A CANADIAN POSTAL M.O.)

*****

SOFTWARE:

NOTE: All cartridges are loose (ie. without box and manual), unless specified. Since all cartridges are used, some labels will have minor defects. Major defects will be listed.

* = (behind minimum bid) indicates a STRONG preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain

systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, with one (1) Atari Joystick, one Atari Video Touch Pad controller, and fourteen (14) cartridges [accessories for cartridges as follows]:

ASTEROIDS (Atari)
BERZERK (Atari) -- WITH MANUAL
COMBAT (Atari)
COSMIC ARK (Imagic)
DEMON ATTACK (Imagic) -- WITH MANUAL
DONKEY KONG (Coleco)
FREEWAY (Activision)
HAUNTED HOUSE (Atari)
PAC-MAN (Atari)
SPACE ATTACK (M Network)
SPACE INVADERS (Atari)
STAR RAIDERS (Atari) -- USES VIDEO TOUCH PAD
SUPER CHALLENGE BASEBALL (M Network)
TARGET FUN (Sears)

This is a complete 2600 system, except for RF switchbox and power supply.

BID #1) MINIMUM OPENING BID OF $40.00
BID #2) MINIMUM OPENING BID OF $40.00
BID #3) MINIMUM OPENING BID OF $40.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

ATARI 2600 SYSTEM, with Atari power supply, RF switchbox, one (1) Atari Joystick, one set of two Atari Paddle controllers, and fourteen (14) cartridges [no boxes, or manuals for cartridges, except Asteroids]:

ASTEROIDS (Atari) -- WITH MANUAL
ASTROBLAST (M Network) -- USES PADDLES
BOWLING (Atari)

CIRCUS ATARI (Atari) -- USES PADDLES
COMBAT (Atari)
DEFENDER (Atari)
E.T. THE EXTRA-TERRESTRIAL (Atari)
GOLF (Atari)
KABOOM (Activision) -- USES PADDLES
MISSILE COMMAND (Atari)
REALSPORTS: FOOTBALL (Atari)
SPACE INVADERS (Atari)
STAR MASTER (Activision)
VIDEO OLYMPICS (Atari) -- USES PADDLES

These are complete 2600 systems. Nothing else is needed to play.

BID #1) MINIMUM OPENING BID OF $40.00
BID #2) MINIMUM OPENING BID OF $40.00
BID #3) MINIMUM OPENING BID OF $40.00

*****

LOT #3 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, with one (1) Atari Joystick, and fourteen (14) cartridges
[no boxes, or manuals for cartridges, except Pac-Man]:

ASTEROIDS (Atari)
BASKETBALL (Atari)
BERZERK (Atari)
CHOPPER COMMAND (Activision)
COMBAT (Atari)
E.T. THE EXTRA-TERRESTRIAL (Atari)
FOOTBALL (Atari)
FREEWAY (Activision)
FROGS AND FLIES (M Network)
MISSILE COMMAND (Atari)
OUTLAW (Atari)
PAC-MAN (Atari) -- WITH MANUAL
REALSPORTS: BASEBALL (Atari)
SPACE INVADERS (Atari)

These are complete 2600 systems, except for RF switchbox and power supply.

BID #1) MINIMUM OPENING BID OF $33.00
BID #2) MINIMUM OPENING BID OF $33.00
BID #3) MINIMUM OPENING BID OF $33.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

SEARS TELE-GAMES (Atari 2600 compatible system) with box, manual, one (1)
Atari Joystick, one set of two Atari Paddle controllers, and twelve (12)
Sears Tele-Games cartridges [no boxes, or manuals for cartridges]:

BASEBALL (Sears)
BASKETBALL (Sears)
BOWLING (Sears)
BREAKAWAY IV (Sears) -- USES PADDLES
CHASE (Sears)
FOOTBALL (Sears)
GOLF (Sears)
MISSILE COMMAND (Sears)
PONG SPORTS (Sears) -- USES PADDLES
SPACE INVADERS (Sears)
TANK-PLUS (Sears)
TARGET FUN (Sears)

The box and manual aren't in good shape, but both are intact.

This is a complete 2600 system, except for RF switchbox and power supply.

MINIMUM OPENING BID OF $50.00

*****

LOT #5

COLECO GEMINI (Atari 2600 compatible system) with system manual, two (2)
Gemini Dual Command controller, one set of Gemini Paddles, one Gemini power
supply, one Gemini RF switchbox, and twelve (12) cartridges [no boxes, or
manuals for cartridges]:

ASTEROIDS (Atari)
ASTROBLAST (M Network) -- USES PADDLES
COMBAT (Atari)
E.T. THE EXTRA-TERRESTRIAL (Atari)
FOOTBALL (Atari)
HOME RUN (Atari)
PAC-MAN (Atari) -- WITH MANUAL
SPACE INVADERS (Atari) -- WITH MANUAL
TARGET FUN (Tele-Games)
VANGUARD (Atari)
CARNIVAL (Coleco) -- STICKER ON BACK SAYS "INCLUDED WITH GEMINI"
DONKEY KONG (Coleco) -- STICKER ON BACK SAYS "INCLUDED WITH GEMINI"

This is a complete system. Nothing else is needed to play.

MINIMUM OPENING BID OF $42.00

*****

LOT #6

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), one Atari controller, Atari power supply, and three (3) cartridges [no box or manual for cartridges, except Pac-Man]:

PAC-MAN -- WITH MANUAL
POLE POSITION
SUPER BREAKOUT

The controller is working, at this time, but the fire button contacts on the inside need cleaning periodically. I will also throw in a non-working controller for parts, FREE.

MINIMUM OPENING BID OF $34.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), one Atari controller, Atari power supply, and three (3) cartridges [no boxes or manuals for cartridges, except Centipede]:

CENTIPEDE -- WITH MANUAL
PAC-MAN
POLE POSITION

The controller is working, at this time, but the fire button contacts on the inside need cleaning periodically. I will also throw in a non-working controller for parts, FREE.

The power supply works, but after testing it I discovered that there are exposed wires at one point on the cord. I would suggest not using it, and I only supply it so that you know what one looks like, and can read the specifications from the power supply itself.

MINIMUM OPENING BID OF $32.00

*****

LOT #8

ATARI 5200 (4-PORT), Atari power supply, one Atari controller, and three (3) cartridges [no boxes or manuals for cartridges, except Pole Position]:

DEFENDER
PAC-MAN
POLE POSITION -- WITH MANUAL

The controller is working, at this time, but the fire button contacts on the inside need cleaning periodically. I will also throw in a non-working controller for parts, FREE.

There is no RF/power switchbox with this system, but I will include plans on how to build one. The parts cost approximately $8 at Radio Shack.

$37.00 Mark_Lambert

*****

LOT #9

ATARI 5200 (4-PORT), one Atari controller, Atari RF/power switchbox, and three (3) cartridges [no boxes or manuals for cartridges, except Pac-Man]:

DEFENDER
PAC-MAN -- WITH MANUAL, AND 2 OVERLAYS
REALSPORTS FOOTBALL

The controller is working, at this time, but the fire button contacts on the inside need cleaning periodically. I will also throw in a non-working controller for parts, FREE.

This system doesn't come with a power supply. The specifications are:

INPUT: 120V AC 60HZ 33W
OUTPUT: 11.5V DC 1.95AMP

MINIMUM OPENING BID OF $30.00

*****

LOT #10

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800 COMPUTER with original power supply, built-in RCA cable, one Atari Joystick, Atari 410 Data Recorder (with built-in power cord and connector cable), and Defender cartridge.

This is a complete system, except for RF switchbox.

MINIMUM OPENING BID OF $40.00

*****

LOT #11

NEW RF SWITCHBOX PURCHASE OPTION

628. Re: CSS`s Fix 2 into 1 for fr

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-26 19:27:24 UTC
From: krishna@primenet.com
Message-ID: <3g8t2s$b0h@news.primenet.com>
Source record: 95168

The 1200XL has a resistor inhibiting the +5 on the SIO. The MPP interface for the 1200XL has an external supply which is why it is more expensive. The sad part is that things like this were engineered for the 1200XL when all it takes is the jumpering of a resistor to put the voltage back to the SIO.

Companies assumed that the end user wouldn't even be able to do that, so they engineered around it.

629. atari harddrive?

Newsgroup: comp.sys.atari.8bit

Ok, question to a point i never fully understood. Has there ever
been a simple plug-and-go harddrive for the atari XL/XE?? something that
just plugged in line with the floppys and printer? or was it all that
cryptic stuff i dont have full info on, concerning MIO cables and black
boxes and whatever?
ungh.

630. adding memory?

Newsgroup: comp.sys.atari.8bit

From: chaos@oo.com
Message-ID: <3g91ng$2hu@tequesta.gate.net>
Source record: 95171

Also, is it possible to simply add memory by soldering in new chips? i was talking to someone in my area, and he was telling me about how way back when he upgraded his XE to higher memory by simply soldering in the chips. Can i do this with my apple GS? i have an extra XL i can cannablize the IC's out of. is there any archive sites where i can find info on this?

i posted this question once a while ago, but i never got a result.

thanks.

631. Atari 800 etc Emulator.

Man, just OPEN a Nintendo controller (and I'm guessing, a SNES one too) and you'll see how complicated it is! Just get a Sega or Sega Genesis controller. No patching needed! B button is normal fire button. C can be easily implemented, the A and Start are a tad harder.

I promised Joe Chiko, my user group's 8-bit librarian (who does not have UseNet access), that I would post this for him. (Sorry for the delay, Joe ;-)

If you have a MIO for sale, please respond by EMAIL to me (do not post it as the article will probably expire here before I get a chance to see it), or give Joe a call, or call SCAT's Graceland North BBS at (708) 545-2554 (24 hrs, up to 14.4Kbps) and leave him email.

Thanks!

>supply, and the P:R: gave instructions on how to jump the resistor.
Resistor R63 is the culprit. The solution is to simply remove it and replace
it with a jumper wire.

Hey Mathy Van Nisselroy:

Good to see you here on the Usenet. I enjoyed reading your
posts......on the Atari 8-bit BBS network.... Haven't seen your name on
USenet until the past couple of days.

Have you been here, quiet, the whole time???

James

638. Update to Atari Books, Software, Games, Hardware Sale, Additions & Subtractions

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-27 12:28:24 UTC
From: lelie@smail.srl.ford.com
Message-ID: <lelie.768.000B3C0D@smail.srl.ford.com>
Source record: 94925

UPDATE to Long list, mags, books, software, games, hardware, additons & subtractions.
This is STILL more than my wife will let me keep!

Here is what is left (if I haven't made any typos!). I get a lot of mail so the first offer will probably get it, but I will TRY to answer everyone as soon as possible.

Please make offer/counter-offer.

Atari Books

Second Book of Machine Language (Mansfield, spiral 442 pgs., Compute! books)
(this one was removed, but I did not sell it, so here it is again)

Compute!'s First Book of Atari Graphics (spiral, 248 pgs)

Games for the Atari (S. Roberts, paperback 115 pgs.)

Atari Basic, Faster & Better (Carl Evans, paper back, 290 pgs.)

Atari Basic (Richard Haskell, paper back, 170 pgs.)

Proto's Graphics Machine (Geoff Caras, Pamphlet, 25 pgs)

Learn to Program Fancy Fonts (Rich Wilson, pamphlet, 68 pgs, w/disk)

IBM-PC (Wilson, pamphlet, 45 pgs spiral)

Atari Dos 3 (pamphlet, 30 pgs)

Atari Dos 3 Reference Manual (spiral, 98 pgs)

Atari Disk Operating System II Reference (pamphlet, 98 pgs)

Atari ST User's handbook (Gilbert Held, paper back, 167 pgs)

Software

Atari-writer CART w/docs

Atari-writer+ docs/w disk.

APX spelling checker disk for Atari-writer w/docs

APX printer drivers for above, disk w/docs

APX Calculus Demon (Disk w/manuel, APX software) {doesn't anyone do symbolic calc anymore?}

B-graph (Batteries Included, disk w/manuel) {Probably the BEST plotting/curve fitting software ever made for Atari}

Programmer's Workshop Stat. Pack. (no docs!)

Alpha Advanced Protection Techniques Disk Utils (disk)

Alpha Systems BASIC Turbocharger (disk w/docs)

Alpha Diskpack 1000 (disk)

MMG BASIC Compiler (no docs)

Santa Cruz Graphics Machine (no docs)

Monkey Wrench II XL (same as Monkey Wrench II but for XL only, not left cart, no docs)

Font Editor (Irata Verlag)

Super Label II (Irata Verlag, no docs)

Allen Macroware Diskwiz II (no docs!)

Music Composer Cart & Manuel (Atari, w/manuel)

Atari Home Filing Manager (disk w/manual)

PRINT SHOP STUFF (Disks w/docs); {how about $1 each for these, or $10 for all 12?}

Graphics Disks for above, #1, #2, #3

Gag Disks for Print Shop, #130, #224, #233, #225, #226 (Icons)

No Frills Software Fonts & Borders for Print Shop

Genesee Atari Group Icons for Print Shop

Genesee Atari Group Cute Labels

Sourcer's Apprentice (Magic Atari Disk)

XLENT Software (Disks w/docs); {Really very good for fancy hard-copy, do a newsletter, and to view 80 col. on screen!}

Rubber Stamp

Typesetter

Page Designer

Mega-Fonts II

Mega-Filer

GAMES

Chess Master 2000 disk for Atari w/manuel

Ace of Aces (Acclocade, disc w/manuel)

Mig Alley Ace (Microprose, disc w/manuel)

225B Baker Street (Datasoft, disc + notebooks) {One or multi-player Sherlock Holmes. Like the CLUE board game}

Eastern Front Cart, Atari, (no docs.)

HARDWARE:

Atari 1010 Program Recorder (Newer Style)

Star Gemini 10" Printer

Protecto Big Blue silent 9", 80 col. thermal printer w/Atari interface & docs.

Atari 810 Disk drive w/power supply

Atari 1050 Disk drive w/power supply

2 good working Atari 800XL computers w/power supply

2 good Atari 800 computers, working (1 CITA, 1 GITA) w/power supply,
$20 ea w/16k, or $25 w/32k, or $30 ea w/48k, or make offers

I got the books some time ago from a friend who was getting out of Atari; they were not mine originally, but I hate to see them go to waste.

|> -double sided, 720K (or 1.44MB if possible)
|> -connects to SIO (no need for a black-box)
|> -Ultraspeed, compatible with the US+ OS.

Itay,

These are (kind of) for sale from CSS. You can buy an XF551, an upgrade kit (from CSS, also from Bob Woolley), and a bare 3.5" drive. I don't own one, but have seen one. The XF controller only works up to 720K, but thats 2800+ DD sectors.

It's also been done, by Chuck Steinman. Called GameLink I. Chuck wrote
a two-player Tic-Tac-Toe as a demo game for it. This method has its limits
on speed. I think somebody may have also written a battleship-type game
for it.

Many auctioners (auctioneers?) post updates *and* mail them out. posting
update lists to newsgroups often gets new people interested in bidding.
I agree that something should be done, though...perhaps the initial posting
like you said, then maybe a very short article saying that updates are
available. I don't know if and how this would hurt someone gaining new
bidders, but I think it's worth it to be courteous to those who read
newsgroups.
Or maybe we could shoot the guy.

DISCLAIMER: Jeez, I was only kidding!!!! (About the shooting the guy! :)

Jeremy, on the lam now

(Discussion of what to do about Mr. Novak's massive auctions.)
The best thing that can be done is nobody participate in his auctions.
His prices look pretty high anyway. I'm sure he enjoys getting even
the discussion about what to do about the posts, he just seems to be
that kind of person. A real pain in the butt. I really don't think this
months old auction has gotten him much in the way of sales, he just
enjoys being the pain he is. So he's sorta like a harassment telephone
caller. If you can, you report him to the authorities. In this case,
there are no authorities, so the best we can do is ignore him.

646. Re: Bill Wilkinson responds

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-28 11:35:56 UTC
From: krishna@primenet.com
Message-ID: <3gda6s$h86@news.primenet.com>
Source record: 95118

Mere mortal Vladimir Elberg provoked me by writing:
: Whatever! All I know is Glenn should be happy for Bill! I mean come
: on now! I have lost any respect for a man that is mad that Bill went to
: another platform, this is outrageous!
: I admit for being out of line, but anyone who thinks the way Glenn does
: is so biased against anyone switching platforms is totally out of line as
: well.
: I think Bill is a cool guy, I dont worship him, but I think he has
: helped the Atari community, which is more than I can say of Glenn.
: To Glenn : Get a life and stop worrying of what everyone else has and
: do something to help the Atari 8-bit out!

Listen, you don't listen.

I don't HATE Bill. I am absolutely NEUTRAL towards him. There is a
difference between reserving my greatest praise for those who I feel
deserve it, and hating him. You say you don't worship him, and so I
think we are closer in opinion than you think.

In a generic context, sure, he's a talented guy, whatever. He deserves
some respect for his past acheivements. But in an atari8 advocacy context
I don't think he should be put on the same level as someone who's still
working with the 8-bit, or even on the same level as someone who left but
still pops in now and again or bothers to fire up their 8-bit on occasion.

My inferrence from his writings in Mapping... may have been a little much,
but I'm just being honest about how I felt when I read those words. How
many technical books like that do you know of go off on a technical
limitation like that? Does De Re do that? On the contrary. De Re goes
to great lengths to talk about how nice the Atari8 is, what kind of tricks
you can pull with it, its innovation with the coprocessors, and so on,
while Bill seems fixated on sheer-processing issues. It just smacked of
contradictions that on one hand Bill decided to devote a great deal of
time to the Atari8 and to help with Mapping... but on the other he sees
fit to criticize it in the same book. It just seems to me that if you
like the platform enough to do as much as Bill did, that you have no right
to whine about limitations otherwise people will wonder why it is you
stick around.

To me, there is no such thing as TOO MUCH atari8 advocacy. As I related
in my post about the apathy in my old user group, the problem is TOO
LITTLE advocacy. Just because there are a lot of people in here who's
Atari8's play an extremely limited role compared to their shiny new
machines doesn't mean they should try to force everyone else to share
their mindset on the role of the Atari8 or how much they can or can't
advocate (lest they disrupt the sensibilities of those who's loyalties are

now firmly with other platforms).

If that's wrong, then the focus of this newsgroup has really deteriorated.

And I need not itemize all the things which I have done to help support the 8-bit. Those who have received my shareware donations, vendors who have received my patronage, and those who enjoyed my BBS when it was up bear witness to that.

Overall I think you are making a mountain out of a mole-hill.

647. Re: Games? ; Connecting 2 Ataris!

Mere mortal Jeff Potter provoked me by writing:

: Chuck Steinman posted suggestions for what was to be "MAGDAR Invasion" as
: I remember. He got -0- responses to the "submit your artwork" contest.
: You guess correctly; the project has gone nowhere. But I can't blame
: DataQue for the lack of interest by the game-playing public. There's no
: satisfaction in spending a year working on something for which there is
: no interest, and hence no market.

Not everyone is a good artist. It was a mistake to measure interest based on submissions. Do you think that since there were 0 submissions that nobody was interested? The messages around that time would contradict that. People like me and others were commenting on it.

Of course, Chuck has never been a genius when it comes to marketing (re: T816).

I tried making a couple images but I was not pleased with the output enough to submit it. I am just not the greatest artist especially when working in gr.15.

There is a program you run from an internet shell I believe called Internet Head2Head Daemon.

Something like that.

The shell does most of the work passing packets.

It's similar to how Xwindow games work.

You might even be able to kludge something up by using 2 IRC bots (just an idea).

There seem to be a lot of people on this group, but yeah, they may not have direct shell access.

But it's really only a matter of time. There will only be fewer and fewer 8-bitters living close to eachother and more and more 8-bitters on the net.

I couldnt agree more. I have 3 running 8bit Atari's at this time, and
parked right next to them is my PC. Without my PC, I'd probably stil
be selling shoes at BASS -- but thanks to SpartaDos years ago, I started
to learn MS-DOS like commands and finally got a job in the computer
industry. Today, I'm an MIS Manager for local county government.

True, my PC has tought me how much I enjoy my 8bit, but the inverse
is true as well.. My 8bit wont allow for a winsock based application
to be loaded up - whereas I can now point and click my way through
the Internet using the PC.

It's a trade-off between the two. I love my 8bit because I now own
every Infocom adventure created. Those will probably never be seen
on the PC (at least not ALL of them [grin]) - as well as other
applications and games.

You really dont need the original ATR disks to use the ATR. SpartaDos will work just perfectly on the ATR8000. You can print from the ATR, modem from the ATR and connect high density disks to the ATR, all using SpartaDos...

If it's an XL you're looking for, contact me via email and we can work out some form of trade. I have about 10 XL's, 3 65xe's and 4 130xe's that are starting to pile up.

Been collecting like mad these last few weeks..

Dont know why, though! [grin]

(Discussion about Bill Wilkinson, etc.)
Vladimir E. and Glenn S. are who we have today. Bill
Wilkinson gave us a way to do what we wanted with our
8-bits. But he's gone. What bothered me about Vladimir was
saying (something like) 'get a real computer'. We here
enjoy this platform for various reasons and I would hate to
see us degrade ourselves into arguments about past glories.
WE are what is happening today. I especially would like to
see B. Wilkinson, Mike Hohman, Bob Puff, Keith Ledbetter
come around csa8 and make a comment or two. I don't like to
see the grumbling about our benefactors that could alienate
them if they come here. But, the grumbling also makes ME
feel a member of the present group of Atari 8 fans and I
understand Glenn's feeling that past greats in our platform
have abandoned it.

Robert Glover <robg@picasso.ICSI.Net> writes:

>I've always enjoyed reading Bill Wilkinson's stuff, and he's one of my
>favorites. Just because he moved onto more profitable things doesn't
>mean he's a traitor. It means he has some common sense.

That last sentence implies that those of us who use the 8-bit
on a daily basis lack common sense. Not exactly the wisest thing to
say in the usenet newsgroup devoted to 8-bit discussions. :)

While I agree that there is MUCH more profit to be gained by
a person using the IBM/MS-DOS/Intel platform, I think there is plenty
of reason for a person who is NOT seeking profit through computers to
use the Atari 8-bit.

I won't go into all the reasons for using an 8-bit again (there
were several discussion threads in the past few months that discussed
this more throroughly than I could in this space). Suffice it to say
that there are those of us whose computing needs are met by the 8-bit.

That said, there is certainly enough room in the world of computing
for people who use different platforms. Mr. Wilkinson has a compelling
reason to use IBM PC's. I don't, so I stick with the platform that makes
computing fun.

It doesn't mean I lack common sense. :)

-Joe

653. Question.

Newsgroup: comp.sys.atari.8bit

From: pwerntz@aol.com
Message-ID: <3gdlsm$f9@newsbf02.news.aol.com>
Source record: 95190

Hi there - forgive me if this is the wrong place to post this.

Not too long ago, while rooting through my mother's attic, I came across my old 130XE and 520ST. Having a sudden childhood flashback (not that it was that long ago), I decided to grab the 130XE and a bunch of cartridges. (Let's face it, today's PC games are great, but the good ol' playability of Defender or Joust just can't be beat)

Unfortunately, after hooking it up (with a new TV/Game switch), all I get is a black screen with the cartridges plugged in (or sometimes it throws me right to the old self-test). However, without plugging them in, I do get the "READY" prompt.

Now, I'm sort of obsessing on getting this thing to work, so here comes the questions:

1. Does anyone have an idea of what the problem might be, and is it fixable?
2. Is it worth it just to buy a "new" 130XE?
3. Can I still buy a 130XE somewhere?
4. Is anyone interested in the 520ST? I also remember seeing a disk drive and I think a modem. It'd be at least a month before I was able to go get it, but I'm not really looking to make money - I'd rather see someone else get some use out of it.

I took a quick glance through the FAQ, but really didn't see the answers that I was looking for. Thanks in advance.

Preston

p.s. - as a long time Atari owner (2600, 400, 130xe, 520st) who moved to PCs, it is nice to see that Atari still thrives somewhere. They were (and in many ways still are) fantastic machines and it's a shame corporate Atari got blown away in the industry shakedown.

>procedure for any platform.

Not true. The old Supra (now KPI) HD interface was as "plug-and-play"
as it gets. You simply bought the package and plugged it into your
PBI and off you went..

K-Products has now modified the KPI (formerly Supra) interface to now
emulate the MIO and the BB and on top of that are adding full
high speed modem capabilities.. I've seen the prototype and it's
awesome!

>happy. I'M HOPING FOR IMPROVEMENTS, HOWEVER!!!

I've heard the minimum system requirements have gone up with the release of
v3.0. What are the minimum system requirements for that version? Also,
do the printer/serial/joystick ports work as advertised? I am curious since
most of what I would like to be able to run is of the application type
program instead of the game software. I still have the 8-bit available for
games, but recently lost my P:R:Connection to a power surge. If I can run
the applications I need on the IBM using its ports I have no need to replace
the P:R:C and then have switchboxes to deal with as well. Along with the
above questions... does the "disk swap" feature work?

300 baud two way has been done if you mean for full communication. It's hard to do more then 300 baud since that is done with softwar interupts because the isn't really a good way i.e. a hardware interupt, every time a JS port changes state.

659. Atari system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-28 18:19:23 UTC
From: shawnh@max.tiac.net
Message-ID: <3ge1rb$t32@sundog.tiac.net>
Source record: 95196

For Sale: Atari 8-bit computer system, with disk drive, printer,
modem, joysticks, software, books, etc.

****

Hardware:

Atari 130XE computer - perfect condition - sorry, no manual

Percomm AT-88 ss/sd disk drive - worked flawlessly the last time
I used it - manual included, as well as OS/A+ operating sys-
tem diskette (not sure if I have the manual for this OS)

MPP-1000C modem: 300 baud, no interface module required - connects
via joystick port - manual included

Seikosha GP-100AT dot-matrix printer for Atari - no manual - in-
cludes ribbon, but it's probably dried out

Two joysticks:
1) Wico Command Control - big, sturdy, in great shape
2) Kraft - small, light, very easy to maipulate... but it's
starting to get flakey

Koala Pad drawing/painting tablet (includes software)

Software:

Cartridges:
Miner 2049er (Bounty Bob, from Big Five Software)
Ms Pac-Man
Donkey Kong
Donkey Kong Jr.
Crystal Castles
Star Raiders (partial docs)
Q-Bert
Dig-Dug
Space Invaders

Disks:
Jawbreaker (similar to Pac-Man)
Castle Wolfenstein
Transylvania
Grandma's House
Hodge Podge
Alternate Reality: The City
Shamus
Apple Panic

Black Rabbit
Temple of Apshai trilogy
Star Raiders II
Frogger
The Eidolon
Rescue On Fractalus

Misc:
lots of odds-and-ends, Basic programs, utilities, blank
disks, etc.

Books:

Atari BASIC Source Book (Compute! books)

Compute!'s First Book of Atari

Compute!'s Second Book of Atari

Mapping the Atari (Compute! books)

Programming the 6502 - Rodney Zaks (Sybex books)

Your Atari Computer - Lon Poole, et al

Kids and the Atari - Ed Carlson

****

Except as noted above, all of the hardware and software worked
fine the last time I used them.

I'd prefer to sell everything as a single package for $99 or
best offer. If, after some indeterminate amount of time, this proves
to not be feasible, I'll consider breaking things up.

Thanks.

Itay mentions that he can't use US+OS with SIO2PC..

Oopps.. ok, I'm wrong. ALL I know, is there's a High-Speed mode on SIO2PC and unfortunately for MyDOS advocates like me (gimme an M! gimme a Y! gimme a D.. an O.. and an S! What does that spell!? MYDOS!!! YAAAAY!) it doesn't support that mode.

Some things do, however. I thought US+OS was one of them.. Mistake on my part I guess. I know SpartaDOS does, and some demos (esp. newer Top-Magazin demos) support it as well (killer! :)).

Anyway.. can anyone actually tell me exactly WHAT works with SIO2PC _and_ supports the High-Speed mode!?

One good FTP site is Atari.archive.umich.edu. You can get to it through
Gopher (I finally tried it; it's great!!!) by Gophering to "gopher.archive.
umich.edu". From there you just move around through the files. You can
look at file lists and actually download files with it. Neat!

The directory is: Merit Archives (when gophering) "atari/8bit/Xf2".

Programs like UnZIP for a PC, UnARC for a PC or for the Atari (under Archivers)
and DiskComm for the Atari or DCMToDisk for the PC will be very helpful.
(Yes, there is UnZIP for the Atari, but you'll need to unZIP your PC stuff
before you can even emulate the Atari in the first place.. so... :))

GOod luck!

I think this might be within the realm of possibility.
For TCP/IP protocol info, you'd want to look at the relevant internet
RFC (I don't know which one). If you can do WWW, there's a pointer to
the collection of RFCs at http://www.cis.ohio-state.edu/

Hmm.. this has been chewed over a few times before. There is now a PATCHED version of MAC/65 which is usable on the PC Xformer. I'm not exactly sure where it is, but it is there at Umich. Jody Lenn or someone should put in a TXT file along with the older MAC/65 mentioning that "PCXF users go get THIS copy instead". And if the PCXF version isn't "as good" or something as the older version, a similar TXT should be put in with the PCXF version.. that way people who don't realize there's more than one version there will find out and be sure to get the correct one!

>Of course I wouldn't want him to post copyrighted software so does
>anybody know where I can legally BUY this software from and possibly
>a ready made cable???

This myth just won't go away!

We can split all software into one of two categories:

1) Public Domain software. Software released into the PD by the
creator/copyright owner can be freely used by anyone for anything, period.

2) Copyrighted software. The creator/copyright owner retains most rights.

Copyrighted software comes in 3 forms:

2.1) Commercial software. May not be copied except for personal use.
Payment is expected at the time the software is obtained.

2.2) Shareware. May be freely copied. Users are asked to pay for it
on their own initiative.

2.3) Freeware. May be freely copied.

ST Xformer is available through many PD/freeware/shareware vendors. I
happen to know that both the software and cable may be purchased from B&C
ComputerVisions. I'm not sure about vendors in the UK.

>Zybex is indeed a great game, do you know it sold for #2.99 (UK

Sounds like it could be the cartridge port. I've heard that the
130XE's cartridge ports have a bad tendency to fail. Anyone have any
other ideas?

>2. Is it worth it just to buy a "new" 130XE?

Dunno if it is worth it to you. You can usually get one for
less than $100 (sometimes MUCH less) from someone here on csa8 who is
selling it. They can go for as much as $175 at the vendors who still
sell them "new in the box" (see the FAQ for details, but look for
B&C Computervisions and BEST Electronics in the vendor listing).

>3. Can I still buy a 130XE somewhere?

See above

>p.s. - as a long time Atari owner (2600, 400, 130xe, 520st) who moved to
>PCs, it is nice to see that Atari still thrives somewhere. They were (and
>in many ways still are) fantastic machines and it's a shame corporate
>Atari got blown away in the industry shakedown.

Yes, it is good to have this forum, but if you are interested in
the 8-bit, there are other resources as well. There is Atari Classics,
a magazine entirely devoted to th 8-bit. There is Current Notes, a
magazine that has ST/TT/Falcon coverage along with 8-bit stuff. There
are other magazines in Europe and the UK as well. Again, check the faq
if you are interested.

Hope you find a reason to keep your 8-bit hooked up from now on. :)

How do you get the directory from a disk? That is, from a program, and not from DOS...

I want to be able to give a list of files from a program, so that the user can choose the one they want to transfer (i.e. a file selector).

Is this going to be one of those, allsorts of ways of doing it depending on the DOS I am using? As I want the program to run under anything if poss.

Thanks,
Richard.

I dont know about the availability of the newly modified KPI, but I know it's close to being done.

On top of being able to run all scsi, mfm and rll, it'll run IDE as well - per a conversation with Bob Klaas. I've already got dibs on the first one!

The following carts are forsale, these carts are XEGS Carts, but will with with XE and XL Computers. I don't know if they'll with either the old 400 and 800's. Here goes.

Archon - New but box is not in mint condition.

Ballblazer - New, box in fine condition.

Gato - New, box in fine condition.

David's Midnight Magic - Used once or twice, box partly crushed.

The price is $6.00 a piece. (Firm)

Also available, 1 XEGS keyboard for $10.00

Atari stuff for sale (new lower prices!)

1 800XL (64K RAM) in original box with original styrofoam, deluxe switch box in its own box, R/F cable, 1.5amp power supply, user's manual and a pre-Super Video chroma upgrade! This 800XL also has Stackpole keyboard. All chips are socketed! Includes cover. Great condition! ---> $35

1 totally stock brand-new 800XL (64K) with original everything! This computer has only been used twice. Once in 1987, when it was purchased, to make sure it worked and once a couple of days ago to make sure it still worked. Pristine condition. Computer in original box, with styrofoam, still has plastic wrap for 800XL, with R/F cable, switch box, and the all-black 1.5amp brick power supply. Looks totally new! ---------> $45

1 Star Micronics Gemini 10X 9-pin dot matrix printer in excellent condition with user's manual, in original box, with roller. ----> $25

1 Percom AT88-S1PD disk drive with Mitsumi 360K Double-Sided, Double-Density mechanism! (like the one in the Atari XF551), set up as master controller with built-in power supply, printer port, working printer cable, extra cable for second drive, and room for another drive in the bay with original box, with styrofoam, manual, cover, OS DOS, and I/O cable. --------> $40

1 Atari 410 Cassette Recorder/Player in original box, with manual, cover and in excellent working condition. --------> $5

1 Practical Peripherals 2400 baud modem with power supply and manual ----------> $20

1 Anchor Signalman MK XII 1200 baud modem with telephone cord, power supply, and instruction manual in original box and styrofoam. Has a built-in interface cable -----------> $10

1 GameMate 2 Remote Joystick Controllers. Comes with two remote control standard Atari joysticks with receiver unit and power supply. Batteries and joysticks included. --------------------> $15

1 Atari 850 Interface with operator's manual, power supply, and I/O cable. Can be used for up to 9600 baud speeds. Built-in parallel printer interface. --------------> $25

1 brand-new Atari Trak-Ball in unopened box ---------> $5.00

1 YORKY 256K RAM plug-in memory upgrade for the 800XL or 600XL which has been internally upgraded to 64K. Upgrade simply plugs into the PBI port on the 800 or 600 XL. Comes with manual and support disk. ------> $40.00

1 1050 Disk Drive with Lazer upgrade (Happy-like clone). Double-density (180K) and high-speed operation. Has brand-new TANDON drive mechanism. Compatible with U.S. Doubler, and works with single, dual, and double-density disks. Comes with instructions and support disk. -------> $55.00

1 PENGO Cartridge game in box shrinkwrapped -$5.00

3 of Your Atari Computer - A Guide to Atari 400/800 Personal Computers book ---------------------------------> $5.00 each

You pay shipping.

>fit to criticize it in the same book. It just seems to me that if you
>like the platform enough to do as much as Bill did, that you have no right
>to whine about limitations otherwise people will wonder why it is you
>stick around.

As you may have gathered from the posts I have made, I am a
fervent advocate of the Atari 8-bit computers. So, please don't take
this wrong.
Your statement above that, if someone does a lot of good for the
ATari 8-bit, they have no right to "whine" about limitations of the
system. I think of it quite the contrary. If someone has worked with
the computer as much a Bill has, then he or she is in a much better,
more knowledgeable position to critisize the system than others. Say,
a C=64 user. :)
In other words, I am MUCH more willing to give Bill some slack
for saying our computers are less than perfect than I am an MS-DOS,
Windows, Amiga, C=64, etc. advocate who has never touched an Atari 8-bit.

Just my way of looking at it. :)

That is not true! I have and copy II option board. There are lot's for copy protected disks it will not copy. Part of the problem is the drives in PC are set at 300 RPM's not 288 RPM's. The software also was not updated to handle several of the newer disk formats on the Atari. This option will only work for about 30-40% of the copy protected disks. The Happy is still the best option.

Right. You need something like the "Deluxe Option Board" that has the
ability to read/write weak bits. Chipmunk won't do it -- the Happy
drive can't make a copy that will run on a non-Happy drive, the Archiver
won't do it either.

I sure didn't like Philip Price's copyprotection schemes. He was the
reason for Happy Backup v4.0 (The Tail of Beta Lyrae). When he came out
with Snookie!, Happy wouldn't copy it initially either; people were
duping the casette version! because they couldn't copy the disk! AR was
cracked quite quickly however. The Tail of Beta Lyrae took a long time
before I saw the cracked file float around and Snookie didn't take that
long to get cracked either.

Ok.. well, I have a Commodore 1084 (needs fixing, but it does sorta work) and I just got a cool 5-pin Atari/Commodore -> Audio/Composite/Choma/Luma monitor cable.

NOW I find out that I need an upgrade to get Chroma out! (Before, Composite through the Luma made 80 columns very readable, esp. if the colors were set to black and white (colors would make grey vertical lines appear when I wasin Chroma/Luma mode, not Composite). NOW I get EXCELLENT, BEAUTIFUL 80 columns (haven't tried it, but it's very very very clean and there's no grey vertical bars when there's colored areas on the screen), but, I STILL can't get any color!

So... when I get my 800XL, if it does NOT have chroma out, how exactly can I get chroma out. I heard the SuperVideo upgrade helps (I never bothered caring about SuperVideo because I've always been happy with my 1200XL's outputs) but I don't believe I have the copies of _AC_ which describe it. Also, I've heard other upgrades help as well... so, can anyone point out a good one?

Thanx in advance!

The thing is, it was a cheap shot. It's one thing to pine for another PMG or multicolored text modes. That would have been within the realms of possibility even in 1979. But he was whining about the inherent operation of the 6502 processor at a time when obviously he was drooling over the 68K which was already out. There would have been nothing that Jay Miner and Co. could have done to please Bill at that time. It's like 'The Atari home computers are 8-bit machines and that by far is their greatest flaw'. So they are 8-bit machines, big deal. That's the way it is. Take it or leave it. They aren't CRAYs and they aren't 68K machines, they can't move 2 bytes at once, but how many affordable processors could in 1979? How many other home computers could? Most of them used the same damn processor (Apple II, PET). If Atari had started using 65c02s or 65802s then maybe that would have appeased him, but what were the odds of that happening? It smacked to me of a simple case of longing for greener pastures and merely a sign of his coming departure rather than a fair critique of the archetecture.

699. Ever a workable 80-column mod?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-29 10:11:39 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950129020130.14638D-100000@PEAK.ORG>
Source record: 95139

You know, I'd be tickled if I could actually use my 8-bit Atari to call up the Internet with. However, I suppose it's just impractical. It looks like the Atari 8-bit line will one day be layed to rest, never having had this problem solved.

I remember back when the MIO was in the planning/announcement stages, there was talk of an 80-column mod. Then, Atari, in all its wisdom, released the XEP-80 KLUDGE. I still have one that's like new....used a couple of hours, maybe. Back when 2400 baud was the standard, it wasn't so bad.... The XEP could sorta keep up. I never liked the joystick interface, and sometimes the computer would crash...and of course, the XEP would sit there ho-hum with no error message. I'd have to keep a TV hooked up, and when the green-screen and TV were on together, they'd make each other flicker.

If it wasn't for the fact that I was stuck with the 40-column screen, I would have stayed with the 8-bit (as my primary workhorse) for a whole lot longer, like many Apple II owners did (with their "extended 80-column cards.") I wish this problem was fixed, even this late in the game, I'd buy it....just to top off my 8-bit computers.

Has anybody had any experience with the "Omnimon??" deal? Isn't this the thing that plots a tiny character set on a Graphics 8 screen? How does it work? Will it go 9600 or 14.4? I doubt it..... Is it legible?

I wish one of the technically-inclined (gifted, I should say) Atari8 users/developers would address this problem. I can only speculate wildly, but couldn't the XEP be modified somehow to interface with the parallel bus? Is the speed bottleneck with the serial interface that the Atari talks to the XEP over the joystick port, or is it something inherent in the XEP board, or the Atari?

Here's to wishin' for a solution to an old, old problem.

James.

(Yes...I know about the Bit3 "Full View 80" - but I don't use an Atari 800, and even if I did, I couldn't find one of those, nor software to support it).

This is a BIT off subject, but my version of the best 8bit Atari would be something like this:

Atari 800, upgraded to 1meg with an XL/XE OS upgrade and useable on a CSS Mux! What a dream that'd be! 4 joysticks, two cart ports, the BEST keyboard in existance - with tons of ram and useable on a hard disk via the MUX!

>critique of the archetecture.

I want to say that I have always been a multiple platform oriented
person, and hence do not want this to be considered flame-bait ...
but one of my biggest disappoinments about the Atari 8-bit
platform was the choice of processor. There were other processors
available that, in my opinion, were much easier from a programming
point of view available in the same time period. I think the 6809
would have been a much better choice, as an example. Pertaining
to the specific complaint related to in the above paragraph, the
lack of 16 bit data manipulation instructions, even the 1802 based
Elf that I started with could load and store 16 bits at a time.

But the choice of processor does not determine the value of the
entire platform, otherwise those of us who love to hate Intel
based processors would have seen the demise of the MS-DOS
architecture long ago (though there are people on both sides of
the fence here, I think the majority of programmer types dislike
segmented architectures). To me, the prime value of the Atari 8
bit platform was the quality of structure in the operating system,
and the openness of Atari in publishing complete operating system
listings and hardware documentation. It was really sad to see
this disappear with the XL line. But the original design was an
obvious effort at porting big system ideas to a small system
platform ... a design for the future rather than a present-day
oriented design.

>everyone look in the mirror) rather than homosexuality.

Programming? It can be explained in one word: masochism.

Other than that, geekdom helps.

Sheesh. BW gone? Anyone have a comprehensive list of his achievements?
They include Atari BASIC, DOS 1 and 2.0, and several portions of the
original OS from what I remember.

>That has been the explanation for many-a-programmer's ability to allocate
>a lot of time for programming.

That and beer.

If you want it to work for ANY DOS then you probably need to check for Sparta or MYDOS because Sparta has byte counts and MYDOS has sector counts for each file.

That's very probable. The two 9-pin ribbon cables are probably wired to
joystick ports 3 & 4.

This modification would also make sense; the Corvus computer-to-interface
ribbon cable was always unwieldy; the plug didn't have a 90 degree angle, so
you had to lay down the interface box behind the computer, then lay the
computer on top the cable and plug the interface in to ports 3 & 4. It
would be much easier to plug the interface board in through the side or rear
of the computer.

: to the specific complaint related to in the above paragraph, the
: lack of 16 bit data manipulation instructions, even the 1802 based
: Elf that I started with could load and store 16 bits at a time.

Atari was used to working with 6502s (re: the 2600). I believe most of their arcade games from this period used 6502s as well. When the Apple II came out, that pointed the way. The 6809 would have been nice, but in 1979, I don't think they would have gone out on a limb with that. As far as 8-bit processors go, I rank them thus:

1) 6809
2) 6502
3) Z80/8080

The 1802 was not considered a mainstream processor for home computer applications although it was pretty cool (cool enough for Voyager I and II).

The way history went, the CoCo, the only system with the 6809, turned out to be a rather utilitarian machine with some graphical and sound inadequacies, whereas the Atari8 doesn't have the same power for multitasking but overall is far more entertaining to use.

So I wouldn't trade my Atari8 for a CoCo.

It's funny, though, when it comes to game consoles, the 6809 showed up only in the Vectrex. Most of them used either 6502 or Z80 variants up to including Gameboy (Z80), and NES 8-bit (6502), both still in production.

If this big flaw in the 6502 was such a big flaw then companies like Nintendo would have shied away from it in 1984 when the NES was being developed.

I don't have any specs on overall 6502 throughput, however, I'm pretty sure that it will blow a Z80 out of the water at the same clock speed. I don't know how it would fare against a 6809 at the same clock speed. Each CPU has its strengths and weaknesses, and the streamlined nature of the 6502 is definitely its greatest asset. Streamlined enough to be compared

to RISCs.

I believe John Harris has more documentation regarding throughput comparisons, at least with 65816 vs. 68000.

While I don't have the specs on 6502 throughput either, I agree
that the 6502 invokes thoughts of RISC processors. When all the hubub
started about RISC machines a few years ago (in the popular computer
press, I mean), it was as if they'd finally discovered that more isn't
better when it comes to instruction sets. Maybe the 8-bit processors
weren't so bad after all. Add some addressing capability and increae
the clock speed, and you've got a very capable processor even by
today's standards. Unfortunately, the public has not (and probably
never will) realized this, and is therefore buying Pentium machines
by the truckload. :(

Since you have a 1050, try one more set of programs, MULE @ archive.umich
It'd be best if you have the text files printed to disk rather then saved
since this would convert Atari's EOL<155> to MS DOS<10,13>. Arc a couple
of files together to get a total file length of about 24k.

Not to be to critical, but whenever you need help, post as much info as possible. For instance: Do you have an Atari sitting next to the IBM or are you going to take the disks to a friend in another country? See what I mean? It makes it so people have to shotgun their answers to cover any potiential hardware & situation you have. People need to know if you have a stock 810 or 1050 vs a Percom or Indus drive. Can the disks be double density or do they have to be single density boot disks? I doubt if Portal can get this out within 24 hours, but if you don't get a satisfactory answer, take it to Email & maybe I can help. BTW: Now that I think about it, I'll take it to Email!

William Kendrick (kendrick@zippy.sonoma.edu) wrote:

: NOW I find out that I need an upgrade to get Chroma out! (Before, Composite
: through the Luma made 80 columns very readable, esp. if the colors were
: set to black and white (colors would make grey vertical lines appear when
: I wasin Chroma/Luma mode, not Composite). NOW I get EXCELLENT, BEAUTIFUL
: 80 columns (haven't tried it, but it's very very very clean and there's
: no grey vertical bars when there's colored areas on the screen), but, I
: STILL can't get any color!

You can get some color, by plugging in the composite only plug from pin 4
on the computer's monitor jack to the video or composite jack on the
monitor. The 1084 will pull some of the chroma signal, but it is not
really adequate. Of course if you have the monitor set to composite only
and not split-video you will lose your luma!!

I can vouch for very usable 80-columns on a Commodore 1084 monitor when
using the luma jack after monitor is set to separated composite chroma/luma.
Not bad at all. In fact, with split video, it looks pretty darn good even
when compared with my NEC 1000 line amber monochrome composite monitor!

: So... when I get my 800XL, if it does NOT have chroma out, how exactly
: can I get chroma out. I heard the SuperVideo upgrade helps (I never
: bothered caring about SuperVideo because I've always been happy with my
: 1200XL's outputs) but I don't believe I have the copies of _AC_ which
: describe it. Also, I've heard other upgrades help as well... so, can
: anyone point out a good one?

Go with the SuperVideo 2.1 upgrade, if you have a choice...

It helps a lot!!!! You will think you are looking at a new computer as far
as the video is concerned, especially on a 1084!!!

Any stock 800XL will not have the chroma pin hooked up (pin 5 on the
monitor jack). You can run a jumper to hook it up and get OK chroma. You
can do the same for the 1200XL too.

The best bet by far is the SuperVideo 2.1 upgrade, especially on a 1200XL.
The SuperVideo 2.1 upgrade on a 1200XL provides for the best color
saturation of all the Atari 8-bits hands down, but it certainly makes a
big difference on the 800XL, and even on the 130XE.

Your eyes will thank you, especially when hooked up to a monitor like the
Commodore 1084, or the older 1701 or 1702, or any good quality split
video luma/chroma capable composite monitor (there are others).

You do need some minimally adequate soldering skills to perform the upgrade, ability to read a schematic, patience, attention to detail, and it does require some parts, and the installation equipment.

NOTE: Bill, ask me in email and I might even consider doing the upgrade for you for parts, labor, and shipping and handling.

Check out the December 1993 issue of the Atari Classics.

All the details are in there.

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
```

600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and 40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.

A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the

XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)

[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)

disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN

that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
P: printer - writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by

using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference

Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with

SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft

of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

>listings and hardware documentation.

Wait, don't I remember some old articles in Creative Computing saying
that Atari would only let them publish info that Atari didn't tell them?

And last night I was re-reading parts of "Hackers", and noticed a line
about the Atari 800 -- something about a great machine that the company
wouldn't reveal anything about.

> It was really sad to see
>this disappear with the XL line. But the original design was an
>obvious effort at porting big system ideas to a small system

Source record: 95008

HI !

For example i have some atr and xfd files from internet that i downloaded
using my 486dx2. Now i want to play those games and run those stuff
on my atari which is about 20 feet away. I don't want to decribe all my
hardware i just want to know all possible methods to do it (play those
games on atari) except that one which involvs connecting computers everytime
when i want to load a program. Hopefully you know what i am talking about.
This is really important to me. Because if it is impossible i will *NOT*
buy the actually ATARI (i don't have one yet but going to buy one).

>know now is ... what type of microprocessor is used to control the
>XF551 drive? Slightly related, are prints of the XF551 available,
>thru Sams or whatever?

The processor in all XF551's i have seen is an 8040. It is a single chip micro controller. It has 256bytes of ram built in and uses an external rom/eprom up to 4k. The 8050 is the same except it can have 4k of interna rom but it can use an external rom also. More ram can be added with external chips upto 256 bytes. Further added ram will require an i/o port for page mapping. 70% of the instructions of the 8040 are single byte, the rest are 2 byte instructions.

I have a philips data book covering a wide range of micro controllers including the 8040. Any further questions will be answered as knowledge permits

Source record: 95015

SSSSIMPLE! Just Open a channel with mode "6" (ie, mode "4"=input, "8"=ouput, "9"=append-output, etc.) and start reading! The file name will be the path and mask you want (you MUST use a mask else you'll get a "bad filename" error (165 in most DOSes I believe).

Example program:

```
10 DIM A$(120),F$(120)
15 ? "Enter file mask"
20 INPUT A$
25 IF A$="" THEN A$="D:*.*"
30 IF A$(LEN(A$))=">" OR A$(LEN(A$))=":" THEN A$(LEN(A$)+1)="*.*"
35 IF LEN(A$)>=2 THEN IF A$(1,2)="D:" THEN 50
40 IF LEN(A$)>=3 THEN IF A$(1,1)="D" AND A$(3,3)=":" THEN 50
45 F$="D:":F$(3)=A$:A$=F$
50 REM <line 30 should really go here!>
55 CLOSE #1:OPEN #1,6,0,A$
60 TRAP 70
65 INPUT #1,F$:? F$:GOTO 65
70 CLOSE #1:END
```

And those lines do:

```
10 create strings
15 show prompt
20 get mask
25 if there's no string (they just hit [Return]), assume "D:*.*"
30 if there's no mask after a path (ie, "D1:" or "D:GAMES>", then add "*.*")
35 if there's a "D:" don't add one
40 if there's a "Dx:" don't add a "D:"
45 ok.. there was no "D:" or "Dx:", so add a "D:"
50 as I said, like 30 should either be here only or be repeated her at line 50
55 open that mask for input as a directory listing...
60 (trap the EOF error)
65 read the string, show it, keep going
70 close up and that's all folks!
```

Later!

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM,

ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

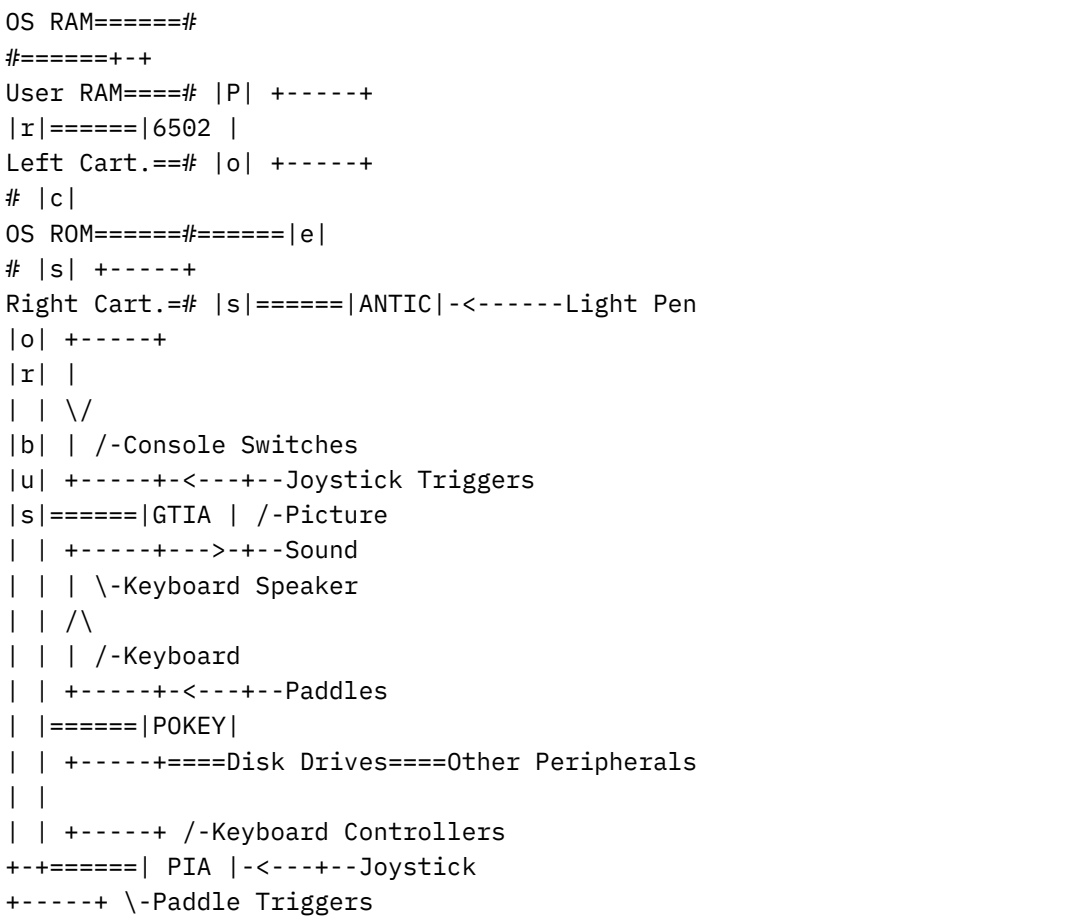
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy

does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text

1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the

Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

---

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

---

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:info-atari8-request@pine.cse.nau.edu

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:info-atari8@pine.cse.nau.edu will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name the parts in the subject line. This is really helpful as the parts usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing

the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
----
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to have seen no uploads for years, but there are some files here that aren't on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen, mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves them to the appropriate directory. Please include a .readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson, mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos, SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National Public Telecomputing Network. It can be accessed by any of the following: telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari Community E-Mail Directory" listing. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There is also a mirror archive site with a Gopher server:

gopher://src.doc.ic.ac.uk/11/computing/systems/atari/umich/8bit

---

Subject: 7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto:eyvind@pvv.unit.no, in Norway.
Last I checked there wasn't anything there, but perhaps there is by now.

http://www.pvv.unit.no/~eyvind/atari/

Subject: 7.2) What is the Atari 8-Bit Home Page?

Run by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper), in
the Netherlands. Very nice.

Interesting resources include:
ASCII: About the 65c816...
Documentation about the 6502/6510/8500/8502 instruction set.
Schematic of a small MIDI interface for the C64
X-Modem/Y-Modem Protocol Reference
Atari System Reference Manual
Rob Funk's Reference Cards
PostScript: Opcode table for 6502c and 65C02
Hypertext: Atari System Reference Manual
Rob Funk's Reference Cards
Software: MODPlay v1.22 Distribution
UnZip v1.13 Distribution

Also FULLY supports this FAQ List.

Point you Web client to:

http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Most resources offered are also made available through his FTP server, the
"Gatekeeper's Archive."

Subject: 7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk, in
Germany. Last I looked, the only thing of significance was News from ABBUC
(German)

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

Subject: 7.4) What is the Big Atari 8bit Home Page?

This home page is kept by Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl, in Poland. Another nice one.

Interesting resources include:
* Atari System Reference Manual by Bob Duhamel
* "Famous Atarians" page
and the following original material by Thomas Tatar:
* Short description of the Disk Operating Systems for Atari 8bit
computers

* Short (so far) description of the Atari 8bit languages
* Atari 8bit copy party, Mirow near Czestochowa, 4-5 June 1994:
Results of the competitions
* Short list of the Input/Output errors

Supports the hypertext version of this FAQ list.

Point your WWW client to
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.html

---

Subject: 7.5) What is the Central Atari Information Network?

CAIN, the Central Atari Information Network, is an independent
Atari user group dedicated to supporting ALL Atari products.
CAIN serves the Atari community by maintaining a FREE monthly
ASCII newsletter and an Atari Special Interest Group on The
Cleveland Free-Net Community Computer System. Furthermore, CAIN
has recently thrown the CAIN Atari Fun Fest, an Atari products
show in the Cleveland, Ohio (USA) area.

http://ace.cs.ohiou.edu/personal/mleair/cain.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online
magazine of the Cleveland Free-Net Atari SIG. The editor is Mark
Leair of the Atari SIG. 8-bit computers support is provided by Michael
Current and Craig Lisowski. For information, write to the Atari SIG at
mailto:xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

This section by mailto:winston@merk.com (Winston Smith)

In the recesses of my memory, I seem to remember ".XMO" as being a "download extender" for the download section of one of the very early ATARI BBSes such as A.M.I.S. BBS. I seem to recall that ".XMO" implies that the file has been transfered with an early version of XMODEM and has therefore had CONTROL-Z pad characters appended onto the end of the file. To retrieve a working file again, the CONTROL-Z trailer padding needs to be stripped off. A copy of the file is made, and then a utility such as Disk Doctor (the original program, not the SpartaDOS utility) / Download Doctor is used to strip off the trailing padding. You probably could just load the file into TEXTPRO and just back over the trailing bytes. The reason to always use a copy of the file is in case of the rare instances where the file actually ends with the CONTROL-Z character. In that case, you don't want to back up all of the way. Bob Puff's SUPERARC was the program that finally saved everyone from the task of manually having to strip off the pad bytes. (Please correct me if I am wrong. In any event, that is what I remember about ".XMO" extenders....)

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer List for complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial version.

The following further info on PC Xformer provided by Bill Kendrick, mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains Sparta/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100

Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 1.0 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: No
Backscroll buffer: yes (One screen)
Capture-to-disk: No
Summary: Excellent for high-speed VT100 emulation
Merit/UMich: Telecomm/icet.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need

a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB

- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB

Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps

Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)

Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, Sparta DOS) - 67000 bps

Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README

Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS

CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 and unique DS system 1.44
meg (HD) nice Z80 CP/M system in which CP/M drive acccess is parallel
only thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC

printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.

XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari
components?

Please let me know if any of this information conflicts with the units
you have!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010
9 V AC 15.3 VA (1.7 A) Atari#CO14319 transformer:
400,800,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA014748 transformer:
400,800,810,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA016804 transformer:
400,800,810,822,850,1010,1200XL
9 V AC 31 VA (3.4 A) Atari#CO17945 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO
9 V AC 50 VA (5.6 A) Atari#CA017964 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO

9.5 V AC 40 VA (4.2 A) Atari#CO61636 transformer:
1027

5 V DC 1.0 A (5.0 W) Atari#CO70042 adapter:
65XE,XE Game System
5 V DC 1.5 A (7.5 W) Atari#CO61982 adapter:
600XL,800XL,65XE,130XE,XE Game System
5 V DC 1.5 A (7.5 W) Atari#CA024814 adapter:
600XL,800XL,65XE,130XE,XE Games System
5 V DC ??? A (??? W) Atari#CO81982 adapter:
XL/XE

6 V DC 300 mA (1.8 W) Atari#??????? adapter:
"410P"

9 V DC 500 mA (4.5 W) Atari#CO16353 adapter:
XEP80,SX212,2600
9 V DC 500 mA (4.5 W) Atari#CA014034 adapter:
XEP80,SX212,2600

9.3 V DC 1.93 A (18 W) Atari#CO18187 adapter:
Indus GT,1 Meg FTe MIO,5200
11.5 V DC 1.95 A (22 W) Atari#CA019141 adapter:
Indus GT

5 V / 12 V DC 1.1 A (5.5 W / 13.2 W) Atari#CO62297 adapter:
1400XL,1450XLD

These draw their power from the SIO +5 V:
XM301 (60 mA),XC12;FTe P:R: Connection

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

The power supply requirements for the following are still needed:
??? V DC ???? A (???? W) Atari#CA016751 adapter:
830
??? V DC ???? A (???? W) Atari#CA060535 adapter:
835
XC11 program recorder (no brick needed -> internal or SIO source?)

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o F.O.R.E.M. BBS -- Friends of Rick E. Moose BBS.
At the time, there were a lot of BBSes around

called things such as "FORUM-80" and "BULLET-80", ergo the name. FOREM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSes that survive today.

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area. I'm not sure whether his BBS for the ATARI 8-bit has been placed into the public domain or not. This BBS was the first to support a RAM-disk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in ATARI BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first ATARI 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an ATARI "very long string" (for which ATARI BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An ATARI 8-BIT version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC-XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SPARTA-DOS environment. This was a problem until very recently, when SPARTA-DOS was released into the public domain. This BBS program uses a "modem clock string" rather than an R-TIME-8 cartridge in order to retrieve the current time. It also comes with an ATARI BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC-XE.
This version of FOREM BBS requires the commercial BASIC-XE cartridge in order to run. It is in the public domain and can import and export messages from the ATARI PRO! BBS EXPRESS-NET (7-BIT text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in ACTION! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

1) See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit news:comp.answers news:news.answers
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

You can also ask me for a copy at mailto:mcurrent@carleton.edu

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, mailto:r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, mailto:71450.1050@compuserve.com.

Subject: 14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, mailto:KAMARO_KID@delphi.com.

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by Bill Kendrick, mailto:kendrick@sonoma.edu. You can write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing covers people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

Mere mortal Rob Funk provoked me by writing:

: And last night I was re-reading parts of "Hackers", and noticed a line
: about the Atari 800 -- something about a great machine that the company
: wouldn't reveal anything about.

Oh, please, don't tell me you came to the same pro-Apple II conclusion
that Levy did. By the time De Re Atari came out, there was enough info
on the inner workings of the Atari8 for anyone. There was only a
relatively brief period of a year or two when people were frustrated by
not knowing how to manipulate DLIs or PMGs. As it happened, the main
threat to the Atari8, the C=64, arrived on the scene long after the
deepest secrets of the Atari8 were fully explored and exploited by lots
of programmers.

Those who talk of the closed-system that the Atari8 was aren't looking
beyond 1981.

732. Re: IBM FILES ----> ATARI DISKS

Why would PC Xformer have an SIO2PC cable with it!?!?!?

I'm (and I'm sure Branch Always Software) assuming that most PC Xformer 3.0 buyers will be people who don't HAVE an Atari 8-bit any more, or at least can't get one near their IBM! SIO2PC on the other hand REQUIRES that you have both an Atari 8-bit and an IBM to get any use out of it (other than making blank ATR files).

Read my FAQ (New Users / Emulator Help) for some help.. (and if you can't find it, BE SURE TO E-MAIL ME and I'll do my best to answer it in the next revision (0.8)).

Good lcuk!

Ok.. to use XFD and ATR files, it's best to have some utilities:
SIO2PC and a cable
PC Xformer 2.5 or 3.0
A 5.25" disk drive on your PC
A DD 5.25" disk drive on your Atari
S2PC or AtarImg for the PC
DCM2DSK on the PC
DiskComm3.2 on the Atari

What I don't get is you said your Atari is 20 feet away but that you don't
HAVE an Atari. !?!?

You question really confused me. Look at the above list and get some info.
on all of it and BE SURE to check both the c.s.a.8 FAQ and my emulator help
FAQ!

Does anyone out there know anything about the internal guts of the 2600? I cracked it open and the thing runs on a 6205 chip. Does anyone know what kind of chips are contained in the cartrige (I lost mine :() and how hard it would be to write custom code on one of these puppies? I'm thinking of converting it to an RF/TV test set and a tone generator.

Please reply by mail as I do not read this group often.

```
The general procedure for reading a disk directory from a program is
OPEN #1,6,0,"D1:*.*"
INPUT#1,A$
Some disk operating systems give a different directory format if you use
OPEN #1,7,0
DOS 2.5 shows some file names in < >; DOS XE, and I think Spartados,
show the long directory format with dates and size in bytes.

Actually, it's "We're DEC". The 6.3 filenames come from the DECsystem-10
computers that Compuserve runs on (or used to run), a system several
years older than the first IBM PC.

: The processor in all XF551's i have seen is an 8040. It is a single chip

8040 is a prototype od 8080 that is a prototype of 8086 and Z80. Cool
isn't it . Therefore IBM and Sinclair machine are BROTHERS !!!
And by the way, ATARI and MAC brothers too.

First, don't believe everything you read in Hackers. JJohn Harris
has said that many of the things he told Mr. Levy were distorted in the
book. There are other inconsistencies in the book, and technical errors
as well.
Aside from that, I believe that Atari was only closed-mouthed
about the computer in the beginning. After all, they did publish the
tech ref notes, OS source listing, and hardware manual, not to mention
De Re Atari. So, they did put the informatin out there, even tho it
did take them a couple of years (1981 or 1982, I think).

Glenn Saunders:

Your form of advocacy is not helpful. There were people like you in the early/mid-80s too. They were so thoroughly unpleasant to deal with that many software developers decided that the Atari 8bit market wasn't worth the hassle.

This wasn't the only cause of the platform's premature demise -- market factors and especially Atari Inc. had a lot to do with it! -- but it was a factor nonetheless. It was certainly a factor in my cancelling my development plans for the 8bit Atari.

In a few short years Bill Wilkinson made amazing contributions to the 8bit Atari platform, more than you are likely to contribute to any portion of the computer industry in your entire lifetime. What is more, he shared information with other developers, including honest assessments of technical weaknesses in both hardware and his own software. When you flame someone for sharing information, you discourage them from sharing any more information.

Think on that before you open your big mouth the next time.

I would have hoped that in the 10 years since 8bit Ataris died that the remnants of the Atari 8bit community would have matured. There were some really neat hacks on the Atari 8bit, much as there were on the PDP-8 10 years earlier (try doing display/audio hacks in 4K with no ROM!). It's sad to see that a few twerps haven't matured yet, and are dedicated to spoiling pleasant reminiscences for everyone else.

Get a life!

Source record: 95033

Can someone name a source to obtain printer and modem cables for the Atari 850 interface module?

I'D LIKE TO SET UP AN INTERNET TERMINAL WITH AN 8-BIT ATARI.

Does anybody know if this can be done? Has anybody tried it? Am I wasting my time here?

Needless to say, 80-col is a necessity. Whether or not the XEP-80 can do 9600-14.4K baud is not known....but I'll figure that it's doubtful. However, I'd like to at least be able to LOG ON at 2400 baud in 80 columns. What software is necessary? Does BOBTERM offer a VT terminal emulation in 80-columns with the XEP-80? How about the OMNIMON (or whatever)? I'd like to know if this is possible asap.

Thanks!

james

744. Where to buy new 8-bit floppy disks

Recently i was really tough and rough to the creators of PC XFORMER.
I think I overeacted a little bit. You can understand someone who
spent , what was that, 35$ or so dollars and got the thing that
does not work the way it was expected to work. Well, anyway, i
really apriciate the try. Even though the thing does not work
completely basic concepts are established and the emulator has
a great future. Therefore I'd like to apologize to Darek Mihocka
and Branch Always software. And even though i am going to return
the emulator back i hope for better and i know that next versions
will be just great. Meanwhile, i'm gonna buy a real atari and
play some games. Oh ! I'd like to thank Darek personaly because
he helped me and other people so many times that he should be paied for
that :-) And his FAQ just priceless !!!! It helped me a lot !!!

GOOD LUCK !!!!
WE ALL HOPE AND BELIEVE !!!!

746. Copyright ?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-30 03:03:55 UTC
From: koutchin@mail1.sas.upenn.edu
Message-ID: <3ghkur$qev@netnews.upenn.edu>
Source record: 95036

HI !

I have some thoughs about the software for ATARI 8bit. NObody dares
to exchange it or give it or put it on ftp cites. Why ? Oh ! You say
that is so called "copyright" software. Well, you're absolutelly right
but look at C64 or ZXS 48/128 soft. What do you see ? YOU SEE IT ALL
OVER THE WORLD ON FTP CITES !!! Isn't that software the "copyright"
software ? Yes, it is. Than why they put it on ftp cites ? Simple.
As long as they do not want to make any money from it nobody minds.
You can say:
"Hey, lotsa stores still have ATARI soft and they sell it. So, they
will loose money in that case and they WILL mind"
Well, go to that stores and you will find C64 and ZXS software as well
as atari software. And furthermore, the software practicaly is created
in the same year. So, what's the difference ? Well, the only difference
that ATARI CORP. still exists and CBM and Sinclair Inc don't. BUt
excuse me, we are not talking about machine macking companies, we are
talking about soft making compnies. And Atari corp. has nothing to do
with soft for 800XL or 65XE or 130XE. I found some paradoxes. For example,
there is a game called MOON PATROL created by OCEAN Soft (yes, now
the company which created EPIC and F29 for IBM platform, they are pretty
cool) So, OCEAN made MOON PATROL for ZX SPECTRUM 48, Commodore 64 and
ATARI 800XL (who knows which one exactly ?) and know we can get
this game for C64 and ZXS from every C64 and ZXS ftp cite but we cannot
gat it for ATARI because evryone thinks it is strictly illigal. THAT IS
NUTS !!!! Ocean does not mind, users want it but nobody dares to get it.
Every other groups of fans of 8bit stuff (C64, ZXS, AMSTRAD) have
their ftp sites (frodo.hiof.no for C64 and a buch for ZXS) but WE
ATARIANS DO NOT ! Why ?

Actually i am obsessed with 8bit computers. I spent more than 1000
bucks last year buying the things but i had to leave to my little
bro who has that obsession too. So, i want to "recover" again.

Please people think about ....
and reply here not buy emal. Let everyone to read what you think.

Now i am gonna watch PASSENGER 57 8th time. :-)

>How do you get the directory from a disk? That is, from a program, and not
>from DOS...
>
>I want to be able to give a list of files from a program, so that the user
>can choose the one they want to transfer (i.e. a file selector).
>
>Is this going to be one of those, allsorts of ways of doing it depending on
>the DOS I am using? As I want the program to run under anything if poss.
>
>Thanks,
>Richard.
>
This is is pseudo-code, but it contains the gist of it.

```
Open #1,6,0,"D:filemask.ext" ; include path, drive spec, etc.
While Not EOF do
Read filename$
Print filename$
End ; do loop
```

This will also print the free sectors count. It will work with all DOSes, though Sparta will only give you the short directory (no time /date).

There was an article in either Popular Electronics or Electronics Now that details a device that does both cases: SNES to a PC or an Atari type connector, and also I think an Atari type joystick to a PC port. If anyone is interested, I can see if I can find the original article and post the magazine and issue.

Do you know the word "CHANGE" or "CHANGES" ? I think here came time
to change things as they are supposed to be. Ok, vendors, they are
selling hardware that is really copyright and pretty often made
in 90th (so it is new hard). But, it is a shame too keep users out
of software. Besides, when i was in my antique shop i found alot
of people buying C64 soft even though they could take it for free from
inet. NOt too many people have access to inet and what kind of
care is care of vendors. DO you really care about the vendors (unless
you are a vendor and hate all other vendors :-) They will continue making
money on people who wants to buy hardware (like me) and on people who do not
have i-net access. And on protected soft and on people who prefer to have
soft in an emazing box with documentation and maybe protected.
Where do you think i got my ATARI soft ? Bought ? You've
gotta be joking. I am not crazy. I am obsessed with 8bit stuff but i pay
only for hard. Soft is too out of date to pay for (it's cool though)
And i didn't miss discussions about copyright. I just think we
have to continue the talk.

753. Where to get 8-bit upgrades/labor????

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-30 05:13:20 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950129210736.20794A-100000@PEAK.ORG>
Source record: 95042

There sure seems to be a shortage of firms which offer 8-bit upgrades and service. I'd like to get the following done:

1) All of my 8-bit floppy drives are old, but seem to work well. I've had some problems losing data, however. I run old Sparta 3.2d. (Yes, I need to upgrade...I just don't have my 8-bit with me at the moment). I figured perhaps the belts are just old....Hell, I don't know. I'd like to have someone check 'em out, and maybe clean, align, and replace the belts.

2) My only memory-modified machine died; probably a bad ROM. Need it fixed.

3) My 130XE cart. slot doesn't work - like to have it fixed, and perhaps the memory upgraded.

4) I'd like memory upgrades on some of my other machines.

5) I'd like **someone** to help me get a hard drive working....I don't know what I need to get one going on the BB, and I don't know what software/formatters I need to run, once I get the cables plugged in.

6) I'd like to get those neat Video/Audio upgrades done, on at least ONE of the machines. Has anyone ever done the stero sound thing (Gumby?)

Thanks in advance.

James

PS- WHY DOESN'T ANYONE EVER REPLY TO MY POSTS? HAS MY DEODERANT FAILED ME???? :)

Hi. I'm looking for two (one for me and one for a friend) Atari 800s--the original beige ones, *NOT* XLs. The GTIA chip would be nice. So would floppy drives--the 810, the big mother, would be ideal.
Programming tools would make me a very happy person as well. Joysticks do not affect my mood whatsoever.

I sympathize with you on that account. I can't get the guys on comp.sys.atari.8bit to reply to my posts, either. Looks like posting is best left to a few guys who interact with each other, while the rest of us dummies talk to the walls.

About the transfer of files: The only way that I have ever done it was with a null-modem cable: I ****ALWAYS**** keep one of these around, along with a slew of adapters (gender changers, DB25-DB9 adapters, etc) so I can plug my Atari into ANYONE's machine and transfer files....with terminal programs. With an Atari 850, I can get 9600 baud...or 19,200 with a Black Box. Fortunately, the 8-bit files are relatively small, so 19.2K doesn't take that long. It is a pain in the ass to bounce back and forth between keyboards of the two machines, but using a batch transfer protocal (like Ymodem) helps.

I know that doesn't help you, because you need an 850 interface module and null-modem cable. It would probably be a good idea to keep an 850, however. Heck, I'd give you one for free if I was home in Alaska....where I have a whole stack of them.... When I get back home in summer, hopefully I can peddle a few pieces of Atari hardware for free....buyer just pays shipping costs. Seems like I'm the only Atari 8-bit user (probably Atari-anything users) in Alaska, when I'm home in the summer.

What might help you is some program that I have heard about on the Umich archive - supposed to allow MS-DOS to read Atari disks. I do NOT know the specifics.....I do NOT know whether or not it can write to Atari disks, or how it handles the difference in speeds of the Atari disk (288Rpm) vs. PC (300rpm).

There is, I believe, a way to hook the 1050 right up to the PC's serial port. All I've ever seen is vague references about this over the net, and, as with other subjects, my questions don't seem to appeal to others....I do not know how feasible this is. There was once a way of doing this on the Atari ST - to hook a 1050 up to the serial or parallel port - I don't know which! I have this cable - although I never tried it on the Atari ST. I wonder if it is the same cable (if one exists) as on

the PC. I wish I knew the name of a reliable source to ask! Good luck!
Sorry I couldn't be of more help!

James Wood

Yikes.. it's people like Artem who keep me from making *commercial* software.
(Him and people like me :))..

Artem seems to want to Pirate everything, which would ruin any of my sales.
I wouldn't want to spend money on anything, which would keep me from having
any sales in the FIRST place. (Yeah, I just bought Alternate Reality,
but it was for SIX BUCKS! That's like two days of lunch to me!)

Anyways.. in the end, both of us are cheap even though they're not exactly
for the same reason.. and in the end, both of us ruin the sale of software.

Hmm.. am I just as bad as Artem? (nah.. I think I'd be more pissed if, say,
David Davies PIRATED my software than if he didn't buy it! :))

<sigh> Once again Artem Koutchine speaks..

Artem.. it seems that this time of "change" is only for your own good.
Now that you're getting an Atari, you decide that it's time for us to tall
(all) give up on actually supporting vendors and developers and repairers
and go around acting irresponsably like the C=64 crowd...

I think most of us here are above that. (Yes, I've techincally pirated
before, but from what I've seen, 99% of us have at least once at one time.)

Anyway.. you say that it's not necissary to have, say, documentation.
Well, if I could, I'd send you a copy of one of the most excellent games
ever made for the Atari, Alternate Reality: The Dungeon.. pirated, of course,
and without documentation. How much would you other c.s.a.8'ers like to bet
that he wouldn't even like the game? WHY wouldn't he like the game? Because
it'd be frustrating or impossible or confusing. WHY? Because he didn't read
the documents. WHY? Because he didn't HAVE the documents!

I could of course go on about how lucky folks like >I< am because of the lack
of document reading out here, but that realm lies more in the masses of
idiot PC and Mac users who are too afraid or stupid to read the documents to
their computer and rather than READING, for FREE (minus time), they spend
$25-50 an HOUR (minus time here, too.. it doesn't make SENSE!?) to hire
someone like ME to either hook it up or show them around.

Anyway.. 2c

Apparently this means that your hardware won't let you read FM (single
density) disks. I can't get it to work either. We don't, as of yet,
have a definitive statement on how to tell if your hardware will do
it, short of trying it out.

> On the other hand, perhaps someone has a way of wiring a PC

>I got one of those) so I can simply copy the stuff onto my HD.

You should look at SIO2PC. It plugs into the Atari like a drive, but
sends all the commands to the PC via the serial port, so the PC can
pretend to be a disk drive, printer, or whatever. I use my 386 as a
file server for my Atari, using 8 Meg virtual disks (MyDOS supports
them).

766. Joining of comp.sys.atari.8bit and the Atari Pro! Network?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-30 08:22:43 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950130002010.5775A-100000@PEAK.ORG>
Source record: 95055

I've been logged on (long distance - ugh!) the Repair Shop BBS, one of the several nodes on the Atari network.

In some messages there, I saw references to the possible incorporation of the comp.sys.atari.8bit as a networked message base over the Atari net.

That would be fantastic. Nothing promotes the survival of the platform as does the bringing together of users. Nothing brings users together like the Pro! network, and the Internet.

Is this really possible, or was it idle chatter? Anybody have the word?

James Wood

767. XEP speedup (from Atari network)

Howdy Folks

The following article was translated by me, Mathy Van Nisselroy (mathniss@link.xs4all.nl), with permission of the original autor, Erhard Puetz, a.k.a. Atreju.

Please keep in mind, that I translated this from German to English, while Dutch is my mother language.

Yes, I hated the XEP 80 too, but I read the following article (I was VEEERRRYYY bored) and it seems this baby is quite capable and can be really fast, even with BobTerm.

The XEP 80

Ever since the 1993 ABBUC Annual meeting (Jahreshauptversammlung) I've been working with the XEP 80 and gained quite a bit of knowledge and experience. I've used the XEP under BASIC, MAC65, BobTerm and from DOS to read texts.
At this time I want to ask everybody

who's got information not mentioned in the manual, to send it to me. I'm especially interested in Information about the Hardware. Like, what graphicsprocessor was used?
While working with the XEP some very annoying things cought my attention. First there is this constant need to switch video plugs. Really nerve recking is readjusting of screen height, horizontal screen position and brightness. The height of the screen is almost right when the XEP is working in the American TV-standard with 50 Hz. But then the screen flickers and who knows how long the monitor will put up with the imposed 60 Hz. I once read that the higher screen frequency increases the current in the coils (Comment by Mathy: I don't quite know what these□ coils are called in English, but the direct the electronic beams that draw the picture on your cathode ray tube (according to this booklet I have)). This increases the load on both the electronics, which might not be designed to handle this higher□ current, and the coils, which might burn out. After switching to 50 Hz though, the screen is significantly higher than the standard XL/XE screen, pushing both upper and lower parts of the graphics off the screen. And the characters look really course. Once readjusted, one is rewarded with a good 80 character screen.

I've heard people say, the XEP would be slow. Well, when I print text to the XEP screen (X:) (original device driver), it rushes by so fast I hardly have time to press Ctrl-1 to halt the screen. Slow you say? Absolutely not, rather fast actually, in my opinion much faster then the original screen editor (E:). So I tried out some demo's. So this is it, they really are slow. But why? For this purpose I printed out one of the BASIC-listings and read through it. And read it again, and again, and again... Oh my God, who committed this crime...Oops, programmed this. At that time I didn't understand the programme, but it was one big chaos and even on the first glance one would find the slowest BASIC solutions. So, I'm gonna cut this thing short and state: the XEP 80 is fast. And this is mentioned in the manual really: Data transfer speed between XEP and computer takes place at 15.7 kBit. That's quite fast, but why this rare number? Why not 19.2 kBit? In that case the XEp would be able to keep up with the highest transfer rate of BobTerm. And why on the other hand, can the XEP only keep up with speeds of 4800 baud under BobTerm, where it should at least get 9600 baud?
Let's start with the number 15.7 kBit. This means 15700 bits per second. The duration of one bit in this case is approximately 63.7 us (micro seconds = 10^-6 or 0.000001 sec.). The time the microprocessor in our computer needs to execute a command is measured in cycles. With the Atari 8bit every cycle takes approximately .564 us. One bit therefore takes about 113 cycles. The execution of a command takes 2 to 7 cycles. While one bit is send, the computer could execute 16 to 56 commands. Let's use an average of 35. Then we can say one thing for sure: our 8 bitter can handle a

transfer rate of 15.7 kBit hands
down. Back to the question why it
only works up to 4800 baud under
BobTerm.

Replies: 0
Origin: BECO TEL +31-20-6326859
Amsterdam NL (node X_176)

Here's part of the XEP driver (V1.2)
for BobTerm:

```
LDX #$00 ; Load X with zero
SEI ; don't execute
IRQ's
STX $D40E ; disable NMI's
STA WSYNC ; pause
STX PORTA ; send startbit
STA WSYNC ; pause
STA PORTA ; send bit 0
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 1
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 2
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 3
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 4
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 5
ROR ; next bit
STA WSYNC ; pause□
STA PORTA ; send bit 6
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 7
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send Mode bit
```

```
LDA #$FF
STA WSYNC ; pause
STA PORTA ; send stopbit
STA $D40E ; enable NMI's
CLI ; IRQ's permitted
LDX #$20 ; wait 90 us
DEX
BPL LOOP
LDA PORTA ; read XEP status
AND #Mask ; ($02 or $20)
BEQ Busy ; XEP not ready yet
RTS ; ready, 1 byte
sent
```

Everywere, where it reads "pause" the computer does the following: NOTHING. This command tells the computer it should halt the microprocessor until one screen line is processed. This seems to take up as much time as one bit at 15.7 kBit, or 63.7 microseconds. This command was issued 11 times, add to that the 166 cycles in the 90 us waiting loop, where the computer can't do much either. That makes 866 cycles or maximum 431, on average 250 commands, the computer can not execute, just because it is halted. The data BobTerm receives via the RS232 interface however, come in faster then they can be processed. The data not processed in time are lost. And this only because the computer is busy doing nothing while transfering data to the XEP.

How could one change this and why could the XEP print to screen even faster yet? The computer has to the

whole job, like for instance preparing the next byte that should be send to the XEP, in the time between 2 bytes. But what if the next byte to be send would instantaneously be available? The computer should get it from the buffer or wherever, while 1 byte is send to the XEP. To achieve this, the byte should be automatically - without the CPU having anything to do with it - be send and this is done by HARDWARE. Such a device is built into the computer and calls itself POKEY. That's the chip that, among other things, handles the datatraffic with your disk drive, printer and cassette. If we then think about how fast the data transfer with a disk drive can be, namely 51 kBit/s with a Speedy or even 78 kBit/s with the HSS Copier (Mathy: both are German hardware upgrades for the 1050 disk drive), it becomes clear what advantages there are to use a hardware solution. As far as I can see, POKEY can not be used for datatrafficing with the XEP, because the XEP uses 9 bit data words during data transfer, where POKEY only uses 8 bits. A standard SIO chip, like the 6551, should do it. Th nineth bit, used to distinguish between data and commands, could be emulated by the parity bit. And here the 6551 has five possibilities: None, odd, even, mark and space parity. How we would handle the nineth bit when the computer receives it is one of the things I have to think about, but it should be possible.
So we take an EPROM, in which we place the new XEP 80 driver, a bit of electronics to decode some signals, a 6551 and a triple DIP switch. The DIP switch is used to select a device number (Mathy: Hmm, nice idea! Where have I heard that one before :-)) and connect the whole thing to the parallel bus of the XL/XE. For the

electrical engineers among you I have to add that the XL/XE first of all needs a couple of powerfull bus drivers in the shape of two 74AS244 and one 74AS245, especially if you're running a BlackBox!

The memory map of the driver:

The driver for the XEP 80 basically exists of two parts. One of those parts is a so called Relocator, meaning, it moves the main programme to the top of the memory.
Now I've recently worked with TurboWord+ und while reading the manual, I bumped into something strange. The driver of the XEP 80 should be called AUTORUN.SYS under TurboWord+ and SpartaDOS, because otherwise the MEMHI would be too low. Read it, tried it, seen it. But why? With AUTORUN.SYS, MEMHI is set at $95FF, when run by hand with XEP80 (RETURN) or from a batch file, it's set at $8FFF. I accepted it for a long time, but since it kept bugging me, I checked into this. I'm not gonna tell you how. But what came out will knock you off your socks. When run by hand, the driver will install itself twice. But only the last one installed will be used. And it installs itself twice, because the file XEP80 ends with an INIT address, instead of a RUN address. DOS jumps to the INIT address ($2E2) after loading the file and when returning, tries to jump to the RUN address. But since there is none, it jumps to

the beginnign of the file, which
starts the relocator once again.
Using a disk monitor, I changed INIT
to RUN and that was it. I was
rewarded with 1.5 kByte more free
memory.

RESET

One thing you can not do is press
RESET or otherwise cause a warm
start. A warm start will
reinitialise the device drivers,
including the XEP 80 driver. One
would think that all values are
entered again, but the value for
MEMHI is NOT entered. Sigh, those
programmers at ATARI, real pro's.
But even they can forget some things.
However, after a warm start, MEMHi
is set to the start of the display
list. With BASIC this is $9C1F. If
you now fill up the memory nicely,
you'll eventually overwrite the XEP
driver, which is located between
$9600 and $9C1F. If at this point
you press RESET again, not even DOS
will be reinitialised and you will be
unable to save anything. And that's
by far not all. Small error, big
results.
Well, that's about all I want to say
about the XEP 80 for now, but the
text is over 10 kByte anyhow. Maybe
it's even usefull to somebody. I'm
always happy to get an echo.

Greetings, your Floppydoc

Erhard Puetz

Erhard Puetz is the floppy repair guy
of the ABBUC. He can be reached via

OK, so I use open #1,6,0,"D:*.*" and read until an EOF - is there a command in Basic to detect this? I can't remember it if there is. Is there in any language for the 8bit?

What I would like to know (this time), is:

- How do you detect an EOF, without having to resort to a TRAP?
and,
- When I get a file entry from the dir list, do all DOS's share the same format? I want to be able to mask off the sector size, and insert a . between the name & extension.

Thanks,
Richard.

From: kendrick@zippy.sonoma.edu
Message-ID: <3gi7qj$bhh@nic-nac.CSU.net>
Source record: 95057

Richard, for file sizes, you just multiply the sector count at the end of the listing by:

1 if it's a SpartaDOS (extended; you know, time, date, etc.) listing
128 if it's an vanilla (Atari/MyDOS) style listing for a SINGLE density disk
256 if it's a vanilla DOUBLE density disk

There was some BASIC code to determine a disk's density posted here a LONG time ago (almost a year maybe!? maybe longer?) but I think it might be DOS-dependant? Maybe not... some sort of CIO or SIO routine...

Anyway.. also, this assumes you know how to use VAL() and LEN() in BASIC. ;)

(PSsstt!!!! HEY! Check out "COM_RUN" at UMich. It's a TurboBASIC XL DOS CLI. It doesn't execute DOS binaries but is full of neat utilities (FIND, TREE, etc.) and other programs (APLAY, PLAY, VIEW, DD3VIEW, DD3CLOCK, etc.))

New facts about the BlackBox

(c) Erhard Puetz November 10th, 1994

This article has been written for the ABBUC magazine. It may be freely distributed but not changed in any way without the authors consent. (Translated by Mathy Van Nisselroy, December 19, 1994)

Some time ago, I printed a letter using StarTexter (Mathy: a German Wordprocessor). I just had bought the BlackBox and therefore played around with it a lot. The transfer from data to the printer struck me as taking very much time. And this with my nice Laserprinter. I prepared a Test text with StarTexter. This ment, totally filling a page. E.g., 79 times the character "A" on a line, with 66 lines.

Printersettings; 12 cpi, Left margin 10, Buffer 10kB.

So, off with the text, stopwatch started. WHAAAAATTT, 14 seconds?!?! This can not be true. a) the BlackBox provides parallel datatransfer, which should be about 10 times faster than serial datatransfer (No Start- and Stopbits, and eight bits are send at the same time) and b) there is a 10kB printerspooler. So that handfull of characters should have flown to the printer in no time. But whatever I tried, nothing helped. So I read the technical page of the printer manual. It says: After a dataword arrived at the interface, the HOST, in my case a 130XE, has to wait 0.5 us and then activate the STROBE-signal, for at least another 0.5 us. Then the printer needs approximately 10 us for the processing, which adds up to

11us. Which means that the printer is able to receive the above mentioned 5280 characters in approx. 0.06 seconds. The difference between 14 seconds and 0.06 seconds was a bit much for my taste. 1.2 seconds (or twenty times 0.06 seconds) should be about enough for the 130XE I thought, we do have to call CIO, which calls the parallel bus and then there are some read and write operations. Well, some of you might think, why is this guys p*ssing his pants for 14 seconds? Easy. Now write a letter with Daisy Dot III. Two pages. That should be about 250 kByte of data. This would take about 7 minutes to transfer, but that's just the transfer. Add to that the time Daisy Dot needs to convert. And Daisy Dot can not convert while printing, so a slow datatransfer really slows down the system. You loose a quarter of an hour for a stupid letter, you could have written by hand in the same time. Since my XE should be able to transfer the data ten times faster, the only remaining source of error seemed to be the printer. So what does this idea do? I wrote to EPSON, raging around about their not so cheap printers being lame. They, being far from stupid, run a small test program under my conditions (text 66 x 80) and achieve 0.14 seconds transfer time.

One fine day I got the idea to try the whole thing with my old Wiesemann Interface. Ready, GO. Measured time: 8 seconds. Say what? Whattheheckisthis? The ancient interface is faster than the BlackBox? So, at it. Letter to Robert Puff. Including return-postage. No answer. Via Internet. No answer. Via the ABBUC BBS. No answer. Fax. No answer either. (Bull sh*t!). I can't see through this BlackBox. Looks complicated. I'll have to accept that.

And yesterday I came to the conclusion that I'm not gonna accept it. So I delved into the operation system of the BlackBox. Looking for what? For a $40 for the printer in DDEVIC = $300. To my own suprise, I found it relatively soon. The reassembling then took quite a bit of time and brain power, but below you'll find the listing I want to talk about. The actual printer routine starts on page 4 in line 2370 with the label IOV. Boldly speaking you could say that it checks if the printerport of the BlackBox will be used. In case the answer is "YES", the data will branch to either send data directly to printerport or save data in a printerspooler. The printerspooler can either be RAM inside the XL/XE, or extra RAM on the BlackBox itself. If the spooler is used, as much data as possible will be put in. As long/soon as this is less than approximately 60kB of data, the wordprocessor or whatever and load other files. The data will then be send from the spooler, per timerdriven interrupt, at about 173 characters per second, if I got my calculations right, to the printer till the spooler is empty. But the slow datatransfer happened without the spooler, so the direct printer routine is the one we need to look at. The most important part you'll find at page nine. And only after a long time I saw what really stood there, in line 4940. It says: BNE WR_OK, which when translated reads, the computer should wait, as long as the printer is ready. This is baloney. It should read, wait as long as the printer is NOT ready. So it should say: BEQ WR_OK. I've tried that out immediately. Once with the original, once with the corrected bug and once with changed STROBE-Timing (Lines 4780 and 4840). All this using Turbo-Basic and BW-DOS:

(Mathy: BW-DOS is a SpartaDOS compatible and written by Jiri Bernasek of BEWESOFT.)

```
10 DIM A$(66*80)
20 A$(1)="A":A$(5280)="A":A$(2)=A$:REM fill A$ with 'A's.
30 FOR I=80 TO 5280 STEP 80
40 A$(I,I)=CHR$(155):REM the 80th char in each line is an EOL
50 NEXT I
60 OPEN #1,8,0,"P:"
70 TIME$="000000"
80 ? #1;A$;:?TIME,TIME$
90 CLOSE #1:END
```

Here are the test results:

- originally the printout would take 664 jiffies = approx. 13.28 seconds
- after the first change 118 jiffies = approx. 2.36 seconds
- after the first change & DMA OFF 87 jiffies = approx. 1.74 seconds
- & new STROBE timing 95 jiffies = approx. 1.9 seconds
- & new STROBE timing & DMA OFF 71 jiffies = approx. 1.4 seconds

With th new operating system of the Black BOX, the BB Enhancer:

(Mathy: this probably goes for the Floppy Board as well, since it also contains the BB Enhancer.)

- after all changes 102 jiffies = approx. 2.04 seconds
- after all changes & DMA OFF 75 jiffies = approx. 1.5 seconds

Wow, really cool to see that data zap to the printer. And I was really surprised about how close my estimated 1.2 seconds came to the 1.4 seconds it really took. I'm happy. But also suspicious, this might not be the only bug Robert Puff left inhere. There always is the possibility of a serious bug hiding somewhere. On the other hand though, the BlackBox has been working for me for a very long time and doing very good. I've got to make a few remarks here. The new STROBE-timing now takes approximately 7 us, about 10 times more then the printer needs. BUT this works on MY printer. How this works out for other printers, I don't know. And then something I've been talking to many people about, including Robert Puff, who even happened to have time for an answer. I said, or bettter yet wrote: Whenever the interface encounters the XL/XE's end-of-line character, called EOL, ASCII value 155 or $9B, changes into CR = 13 ($0D) or CR + LF = 13 + 10 ($0D, $0A), graphicdata might be changed in my opinion. When a 155 appears in a picture, the interface changes this into a 13, resulting in an error in the picture. It's even worse if a LF is added. In that case, the printer will not receive the amount of bytes announced in the graphics data command, e.g. 641 bytes instead of 640 bytes, confusing the printer. For the interface has no way of knowing if it's converting graphic or text data. Let's look at page 6, line 3120 and following. There it says; take a character from the buffer. Is it EOL? If yes, convert it into CR. Which creates an error if it's graphics data. And there are so many commands for graphic print-outs, that an interface would have trouble recognizing all of them. What if one sends downloaded

charactersets to the printer? It's been 10 years ago already since I first found this error. At that time, I had just written a driver, that would pass-through all ATASCII characters when printing a BASIC listing. The special characters where send to the printer as graphic data. The character Ae (upper case character A with two dots over the A) always made trouble. When I looked at the graphics data a bit closer, the value 155 actually showed up. I then changed the character in such a manner, that 154 or something related came out, it worked.

Last remark. The operating system of the BlackBox has a checksum. At least with the Enhancer, the change did not stay unnoticed. It always beeps for a second, when I open a certain menu (no food on this one). But maybe good old Robert will get his hands on an ABBUC magazine.

So that's it, goodbye and thanks for all the fish.

Your Floppydoc

771. Re: Disk directory - how?

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-30 08:44:26 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3gi8ta$bvp@nic-nac.CSU.net>
Source record: 95059

I just though I'd let folks know a REALLY neat trick which lets you
convert a directory listing into a file listing.

ie:

```
* ABCDEF 123 0054
QWERTYUIABC 0003
1234 FREE SECTORS
```

into:
ABCDEF.123
QWERTYUI.ABC

The first type is one which assumes all files have the same extenders.
Say you did a directory listing of "*.TXT".

```
Step 1: Get the 1-8 letter part of the name
NAME$=FILENAME$(3,10) : rem FILENAME$ is what's read from INPUT #1
Q=INSTR(NAME$," "):IF Q=0 THEN Q=11 : rem find first space character
NAME$(Q)=".ext" : rem append the extender (like .TXT)
```

For those who don't know, INSTR is a function which returns the first
occurance of the second string (in this case, the " " (space)) within the
first string (NAME$) or 0 if it's not there. (Which means that my "Q=11"
should be CHANGED to Q=9! I forgot that NAME$ isn't FILENAME$! :) It's
9 because since there are no spaces in the name, it uses up all 8 available
characters so you of course put the extender AFTER that (starting at position
9 in the string)).

Oh.. this message is a mess. :) (I put the "MESS" in "messages!") I forgot
to keep going with the "Step"'s up there. Oh well.. ANY-*WAY*!

The OTHER type is one which reads a "*.*" directory.. some IF/THEN block
may determine if the files listed are ones you want (ie, say you wanted
not only ".GIF", but also ".JPG", ".RLE", and ".PCX"...)

```
Now it's like this:
NAME$=FILENAME$(3,13) : get all of it, including the extender
Q=INSTR(NAME$," "):IF Q<>0 THEN NAME$(Q,Q)=".":GOTO sameline
Q=INSTR(NAME$,".."):IF Q<>0 THEN NAME$(Q)=NAME$(Q+1):GOTO sameline
IF LEN(NAME$)=11 THEN TEMP$=NAME$(11):NAME$(11)=".":NAME$(12)=TEMP$
```

The 2nd line changes all spaces into dots:
ABCDEFG TXT -> ABCDEFG.TXT
ABCDE TXT -> ABCDE...TXT
ABCDEFGHTXT -> ABCDEFGHTXT

The 3d line changes all ".."s into just "."s:
ABCDEFG.TXT -> ABCDEFG.TXT
ABCDE...TXT -> ABCDE.TXT
ABCDEFGHTXT -> ABCDEFGHTXT

The 4th line forces a dot in between the name and the extender.. well, oops.. the "IF" part is wrong. It should be "IF INSTR(NAME$,".")=0", not "IF LEN(NAME$)=11" because when you have a 7-letter name and a 3-letter extender, the dot in between will make it a total of 11 characters, in which case the THEN part as listed ABOVE would add a 2nd dot.

Also, the 4th line is useless if you're using only MyDOS 4.53. It allows missing "."s.. "**"="*.*", "ABCDEFGHTXT"="ABCDEFGH.TXT", "ABC*TXT"="ABC*.TXT", etc. For compatibility with SpartaDOS, Atari DOS, etc., it's best though to keep the "add a dot if there is none" part of it.

......

Other useful things I can write off the top of my head nowadays include things to determine the path, things to determine the filename from within a string (which has the path and filename), etc. I could probably even write my own routine to emulate a DOS's built-in "*" and "?" wildcards!

(This is useful because, say you had a directory with these files:
ABC.TXT
: MORETEXT
QWE.COM
A1.TXT
A2.DOC

And you were making an editor program. The user said he wants the directory mask to be "*.TXT". It'd be useful to ALSO list the directory "MORETEXT", even though the DOS would not (since it does not have ".TXT" at the end!).

Step one would be to change any "*"s into sequences of "?"s.
Step two would be when reading the directory listing, you compare the strings which were read in with the string containing the wildcards (or no wildcards at all! Why not list both "A1.TXT" and "MORETEXT" when the user says the mask is to be "A1.TXT" <- no wildcards here!).

)

Anyway.. I could keep going on all night about this but I've REALLY got to go to bed! :)

Why not get an XL and then either run TRANSLATOR or install an 800 OS into it?
My one 1200XL is stock: 64K RAM, 1200XL OS
My 2nd 1200XL is not: 256K RAMbo, 800XL OS and 800 OS (switchable)

Of course; if you want 4 stick ports, that's another question..

compatibility wise (PBI, RAM upgrades, OS, etc.) the 800XL is best choice!!

I'm interested, but unfortunately don't have access to a Windows machine
right now. (OH WELL! BAHAHAHHAHAAAAHAHAHAHAHAAHHAHAHAHHAHAHAHA!)

Anyways.. my interest derives from:
My work with HyperCard
My programming on HyperIt!
My writing of the PC XF3.0 docs and Atari new user / emulator FAQ
My upcoming WWW home page
My work in the ADOS team

If you end up making a WWW page with it, I'll be sure to add a link to it
when I make my own page! :)

NOW.. on another note: PEOPLE! USE GOPHER TO GET TO THE UMICH ARCHIVES!
IT'S BEAUTIFUL! :) Gopher to "gopher.archive.umich.edu." Now.. about
SENDing files to it, just send them to Jody Lenn (either his address or
the "archive" address, niether of which I can remember right now!) via
e-mail UUencoded.

Can you upload via Gopher?

What is with all of these "for sale" and "auction!" posts which are

all double spaced!?

I mean, is it something with Usenet that when it sees "for sale" in the

subject line, it has to double the height of the post? Or are all of

these posts from the same person? Or maybe it's a PC thing with the

useless LF characters.. Man, PC ASCII is OUT OF >DATE<!

Richard! :) See my posts re: file size and re: adding dots! Wow! I answered your questions before I even read them! I'm >GOOD<! Heheh..

Now, as for EOF.. yes, you can detect it. I think MyDOS sets error 3 on the channel when you do a STATUS, but I don't know if ALL DOSes do. In BASIC, your best bet is a TRAP. It's simple. It works. You can even make a trap which emulates a GOSUB. Say you did this:

```
10 ERROR$="Can't open":TRAP 1000:G=10:OPEN #1,4,0,"file"
15 ERROR$="Error reading":TRAP 1000:G=15:INPUT #1,A$
20 ERROR$="Error closing":TRAP 1000:G=20:CLOSE #1
30 END
1000 ? "Error ";PEEK(195);". ";ERROR$
1005 ? "Press [Return] to Retry":INPUT DUMB$
1010 GOTO G
```

Action! (which btw was for sale for >$3!<.. what funds did you need to get up to $3!? hehehe :)) has an EOF() function. I don't remember, but TurboBASIC MIGHT.. but I think I'm wrong about this.

People who know: How does Action! do it? It might just emulate a TRAP/GOSUB just like I did!? HHEHEHE!

Message-ID: <belitz.150.000AF50D@genesis.informatik.rwth-aachen.de>
Source record: 95067

Hello !!!

I have heard a lot of putting original PC-stuff to Xl in the last time (f.
e. floppy disks).
Now I'm wondering if anybody has made the PC-filesystem readable so that you
will get your Atari-Files on PC-disk (f.e. 720k 3 1/2 ").
I couldn't understand the programmers of Sparta-Dos - they created a
filesystem that differs from the old ATARI one, included some PC-features (
look at subdirs, date, time) - but didn't use the PC-one.
Anybody here could give me explanations ? (some weeks ago I didn't know,
that something like Spartados exists on XL B-) .

Matt

I thought we were talking about software on the ST side which accesses the
atari 8-bit hardware through the XFormaer cable, not ST XFormer itself!
I own a copy of a program which enables you to use atari 8-bit hardware as
if it was 'normal' Atari ST hardware. For example, if you hook up an atari
1050 to your ST, it creates a standard atari ST file system on the disks by
using 4 physical sectors for 1 logical sector. I stated it was copyrighted,
which is true, but you might be right that it's not commercial and that
I can distribute it through the net. Have to check for that...

Certainly, isn't the MSX computer clocked at 8 MHz?

>don't know how it would fare against a 6809 at the same clock speed. Each

Blow it out of the water! sure the 6809 has a lot of registers and complicated
opcodes, but since there are so many, the processor require a lot of
tics to decode and process the instructions.
I agree in that you could make nicer looking programs with 6809, but
it in a way becomes like comparing Basic vs. Assembler once again, on another
level, though...

The true PC filesystem may require too much memory overhead to be viable on an 8-bit CPU.

There is also the issue of copyright. I don't know how Atari's ST got away with its MS-DOS ripoff filesystem.

Mere mortal Mark Crispin provoked me by writing:

: I would have hoped that in the 10 years since 8bit Ataris died that the
: remnants of the Atari 8bit community would have matured. There were some
: really neat hacks on the Atari 8bit, much as there were on the PDP-8 10
: years earlier (try doing display/audio hacks in 4K with no ROM!). It's
: sad to see that a few twerps haven't matured yet, and are dedicated to
: spoiling pleasant reminiscences for everyone else.

: Get a life!

Forgive me for thinking more of the PRESENT than the past tense where the Atari8 is concerned. Reminiscences are nothing but boring to me. The Atari8 has been around for over 15 years. How many times can people on this newsgroup say 'Bill Wilkinson was great for developing OSS'? We know it already. Why should we be stuck in a timewarp and do nothing but rummage over the past? It's NOT necessary to do this no matter what people say. Any recent Ol Hackers disk will prove that, with how it puts new spins on old or overlooked software as well as other new tools and stuff gleaned from Europe.

It was endless reminiscences that turned my usergroup into a phucking BORE.

You obviously equate the level of usership of the PDP-8 to the Atari8, but it's not quite there yet. As long as there are lingering developers around, I choose to reserve my maximum reverence to them. Did Bill go out on a limb and buy out the 8-bit rights from ICD when everyone around was rolling their eyes over what they wanted for it?

You are free to deify anyone you want, but I think my emphasis on the present and not the past is far more productive than endless reminiscences and I refuse to put Bill on the same level as those select few who are still with us. Your haste to resort to invectives only undermines your 'holier than thou' attitude. What we have here is simply a difference of opinion on who deserves our respect. Just because you think I should bow down and worship Bill for his decade-old acheivements and I don't think he deserves any more accolades these days isn't cause for a flamewar.

Source record: 95078

```
// Auction //

I have the following for sale:

European versions of Atari XE video game carts. All games are brand new.
These are PAL versions, I don't know if they can be played on other systems.

The games are:

* Barnyard Blaster, RX8086. Light Gun game, blue box says "Also plays on all
XE and XL computer systems". Game is in box, shrink wrapped.

* Lode Runner, RX8082. Blue box says same as above. Game is in box, shrink
wrapped.

* Bug Hunt, RX 8087. Just a brand new cart, in shrink wrap (No Box!). I
think this game came with the XE computer and Light Gun set, so it's
probably a light gun game (picture on cart also makes me think so).

Minimum bid on each cart is $10, because shipping is included.

Auction rules:

* minimum increment is $ 1
* I pay shipping, your bid is all you have to pay
* if you bid high enough, I will open the shrik wrap to see what manuals
(in which language) are included
* auction ends friday 17 februari unless bidding is still frequent

The sector count in a directory can be used as a guide. The only problem is distinguishing between SD and DD disks (125 or 253 bytes/sector).

Well from the portal ftp area, once when I got frustrated trying to ftp to get a free line to umich I went & did an "open portal.com" and got connected to my own service. I guess I could've done it multiple times to see what happen, but never tried it<g>. It's a commercial service so I don't know if they'd support file transfers via ftp to non-portal users. The ST Xformer cable I have is just [any Atari disk drive]=ST printer port, but my hunch is Derek will support (if he doesn't already) the same cable on the IBM.
I would guess STXformer would be available at the archive.umich.atari.st via ftp, but I've never even been in the ST directory there. If you really want the thing & can't get it, let me know & I'll see about getting you a copy.

All DOSes except mydos use a 3 character length field;nMyDos 4.50 uses 4.
MyDos 4.53 uses the three character file length field.

You'll have to resort to a TRAP to emulate a while not EOF in Atari BASIC.
My preferred technique to to have the line that the TRAP send the program to
check the error number, in location 195 ($C3). An EOF error is 136, I think.
(Check that before you use it).

Dave

I've never heard of the 1802. (Other than the Commodore monitor :)
Who was this processor by?

> It's funny, though, when it comes to game consoles, the 6809 showed up

I'm getting a little off topic, here.... But have you guys
noticed the "Super Game Boy" adapter for the Super NES? THis allows you
to put your Game Boy (Z80) games in your Super NES (65816) and play. How
is this done? To my knowledge, the 65816 in the SNES only runs at
3.something Mhz. Is this fast enough to do Z80 emulation in software?
(How fast is the Z80 in the Game Boy?) Is there some trick hardware in
the "Super Game Boy" that does the work?

>

????? ???????

Joust bitmapped? Are you kidding?
I think Joust on XF sucks because
A) The screen is 160x192 and doesn't support wide-screen (on a true 8-bit
the image goes beyond the horizontal borders)
B) The virtual keyboard joystick sucks, and doesn't handle holding down
an arrow key while repeatedly pressing 0 (fire) properly. Instead, pressing
0 causes it to ignore the fact that you're still holding down an arrow key.

A comment on Joust: Collisions seem to work, since they don't use the hardware
registers, it's calculated by the software (in Archon no-one wins in battles!).

Defender is REALLY cool, but I still find the game unplayable due to the
inept joystick emulation.

799. building printer interface box for 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-30 22:04:53 UTC
From: wing@research.canon.oz.au
Message-ID: <D38o06.Bt3@research.canon.oz.au>
Source record: 95089

Hi,

I remember a few years ago there were people selling printer interface that connects the parallel port of the 800xl to the centronics printer. I cannot remember who these people are anymore.

Anyway, I would like to connect my 800xl to my epson mx80 (just for fun. I can do serious printing with my pc/linux and laserjet 4l :->). I am wondering if anyone in this newsgroup have tried building similar interface for their centronics printer. It would be interesting to see a design implemented using programmable devices like EPLD (electrically programmable logic device) or FPGA (field programmable gate array) or other similar devices. Timing diagrams of the various signals used by the printer port would also be useful.

In addition, does anyone know if we can use the SIMMs for PCs on my 800xl memory upgrade?

Thanks in advance.

Regards

Wing C.

Just wanted to say that it's a GODDAMNED good thing that I do have a PC
Clone computer, because if I didn't I wouldn't even be able to get
online. I can find floppy disks everywhere, repair shops everywhere,
modifications/upgrades everywhere, software everwhere.....and if there's
anything that I can't find, there's AT LEAST some kind soul thoughtful
enough to hit the [R]eply key.

However, this is the state of my Atari stuff:

1) Out of several machines, the best ones (130XE, 256K 800XL) have problems.
2) My floppy drives are getting old and in need of a tune up

3) My disk media is all getting old and important titles should be backed-up if I could find disks.
4) Don't know where/who to get upgrades/repairs from (audio, memory)
5) Nobody volunteers any information

I can only conclude that:

1) Users on comp.sys.atari.8bit don't give a shit
or
2) Users on comp.sys.atari.8bit have no need/never did/never will for the strange things that I ask for (disks, service)
or
3) Users on comp.sys.atari.8bit are all experts with hardware, and perform all their OWN hardware modifications/upgrades
or
4) Users on comp.sys.atari.8bit never have problems with their Atari hardware so they don't need repairs, and they use the equipment in stock form so they don't need upgrades (use stock & toss when broken)
or
5) Users on comp.sys.atari.8bit find the questions that I ask to be rather difficult.
or
6) Any combination of #1 and any of the above.

Geesus..... I *love* my 8-bit Atari (I have gobs of hardware/software at home), and I have no intention of giving it up. However, I do not find it indicative of a healthy 8-bit following when such simple (but necessary) questions go unanswered. Is there a charge for such information? Should I post my VISA card number on here?

There are a few exceptions. However, while I can't pronounce this newsgroup "dead" because of the traffic, it may as well be. Why?? I can post a question on rec.autos.vw about how to get heater boxes for a '71 VW van and get a flurry of replies. I can ask about putting 11:1 pistons in a 350 on another conference with equal success. BUT on this newsgroup....my FAVORITE of them all....I can't even find out where to get disks or a RAMBO installed.

Thanks a lot. Thanks for nothing. This does little to perpetuate the existance of my all-time favorite computers. However, I suppose in proper perspective, the sad situation here can do little to harm the 8-bit..... I suppose it just instilled in me a false sense of hope, once I started reading this newsgroup. I now know better.

James

Yes, the error register is kept at RAM location 195 (decimal) and an End Of File is error 136. (I believe it's an OS error, so it's not DOS-dependant).

Also, not all versions of MyDOS 4.53 support 3-letter sector counts. I have (and always use) MyDOS 4.53/4 and it presents 4-digit sector counts. There is also of course a MyDOS 4.53/3, AND there is a way (I think Rick Cortese might've posted this a while back (or long ago and I saw a printout I made a while back :))) to change back and forth between the two yourself.

I think all versions of MyDOS 4.5x (4.50, 4.53/3, 4.53/4) use 4-digit FREE sector counts, and also I think some might support 5-digit. I'm pretty positive that 4.53/4 does, so I'm guessing 4.53/3 does too. I'm not sure about 4.50 though.

As much as Glenn doesn't want anyone to talk about the past (I believe he called it a 'phucking bore') most of the software available to 8-bitters are 10+ year old efforts. We owe the current level of success the 8-bit has to the software that has been built up over the years. Concentrate only on what is new and you don't have much (I'm sure I'll get flamed with a list of new developments, but they aren't enough to make the 8-bit viable IMHO). Why not split the group into:

comp.sys.atari.8bit.users

and

comp.sys.atari.8bit.developments.this.month

and then we won't 'bore' anybody.

Ok, well, was it WORTH playing MegaBlast with a simulated 6-floor screen
from across a room? :)

How does it work? Does it warp the screen or something and then you get
to "scroll" it by looking up and down? Actually, now that I think about it
(6 FLOORs high and across just a ROOM) that sounds pretty awesome!

Did you try Pole Position with it? Hehehehehehe...

Hello to James Wood and all you other Atari 8-bitters.
I was really glad to have read
yours and Artem Ateksandovich Koutichine upload regarding PCX Former.

Thanks also go out to other Atari News readers who answered my request and sent me the FTP address of the shareware version (atari@atari.archive.umich edu). Although I have tried numerous times I have been unable to log on to this address. It appears that have restricted access times.

David Wyn Davies (The Atari Classic Programmers Club) sent me the address of the Uk's largest Atari 8-bit supplier who also supplies the commercial version (ver 3.0 I believe) in the West Midlands, Uk. The address happens to be about two miles from where I live. I shall be visiting there within the next day or two and because I would also like this emulator for my PC, will be asking a few questions on all our behalfs. I'll let you know how it goes.

Although I'm new to this particular group my 8-bit Atari experience started about 11 years ago. I started off with the Atari 400, then joined the BUG club (atari Birmingham Users Group), any Uk members out there? Moved on to the Atari 800 and then straight upto the 130XE and 1050 disc drive. We even designed and marketed (for a short time only) a doubler board which allowed the user to double the space and speed of discs. It's been onwards and upwards since then, ST's, Amiga's and finally my trusty PC.

One memory sticks in my mind. Some years ago not long after Jack Tramiel took over Atari I visited a computer show in London and there he was. It was like standing next to a film star. For months the Uk magazines were printing story after story about the new Atari family. Where are they these days. I haven't heard their name mentioned for years.

It was only a week or so ago when a mate brought his XL down from the loft and it got me thinking about the good old Atari days (thanks Jon). So here I am looking for a decent 8-bit emulator. Are we going to be stuck with the working Sinclair ZX Spectrum and C64 emulators!!!! Stay tuned...

It might be cheaper to buy a happy modified 1050 for $60, I seem to remember that
it (happy) could backup most software. My happy board eventually
died but not for 10 years first. The only program that I couldn't
backup was Seven Cities of Gold, something to do with spiral sectoring

Well Artem.. you can keep saying this and saying this, but you're going to
affect very few people.

I never said I'd plan to make a living on Atari. I said if I were to release
some of my software as _commercial_ software versus PD/Share/Freeware.
I think the farthest I'd go is Shareware unless something like Geneocide
comes out being VERY good in which case I might actually consider selling
the full, final version and releasing a demo version (like many others do).

I'm a student too. I have no job either. Spending $35 on a new Atari is
a bit steep for me, even though I do have a savings account. Lately I've
been getting FREE stuff. My 1200XL was free. My Action! cart. was free.
My ComputerEyes and Parrot were free. My monitor cable was free. My
monitor was $25. My SIO2PC cable was free.

Where did I get this stuff from? From all of the people on c.s.a.8 who
don't seem to agree with you about pirating. Does this make sense? YES!
In a twisted way. They did that to HELP me. If they were to pirate my
software, or I was a vendor and they pirated ANY software, THAT would be
hurting me.

It's not intelligence. It's not the money. It's a mix of morals and
COMMON SENSE.

: monitor was $25. My SIO2PC cable was free.
: Where did I get this stuff from? From all of the people on c.s.a.8 who
: don't seem to agree with you about pirating. Does this make sense? YES!
: In a twisted way. They did that to HELP me. If they were to pirate my

Unfortuanatelly i and most of people do not have such great friends (
you're really lucky one) and i and most of people have to pay lotsa
bucks for the stuff and lotsa people do not want to return to ATARI
>> ONLY <<< because it will cost them lotsa bucks and as we all
remember there are 100s even 1000s applications for atari and
since the computer is pretty weak (compare to pentium) you can't play
a game for a long time and you will want another bunch games in a week
escpecially if you just returned to atari and want to taste all that
soft again. And it will cost you more that the actual computer.

: software, or I was a vendor and they pirated ANY software, THAT would be
: hurting me.

What ? I don't like vendors. Do you ? They're never online, they never
ask what people want. DId you see more than 3 messages from vendors in
this newsgroup ? I did not see one. Besides, most of vendors make their
money om HARDware not on SOFTWARE. And as long as we cannot upload
hardware (:-) Certain technical problems) They will continue suck your
money for stuff that should be free by now.

: It's not intelligence. It's not the money. It's a mix of morals and
: COMMON SENSE.

Oh really, It is not a mix of morals and common sense. The common
sense is people do not want spend their money and the morals say
that if nobody cares about something that something belongs to
everyone (that's about soft).

| There was another argument:
| If we make all soft pd nobody will want to make new soft for atari.

Get real !!! ATARI 8bit is dead for a long time already and we are
the only once who still crazy about it (it is kinda mental illness)
And the people from EUROPE who still create soft for ATARI will continue
to do it. Again, look at C64 users. Thay all old soft and they have vendors
(LOTSA NICE VENDORS that do not mind that all old soft is pd). By OLD SOFT
i mean all sotf created before sunset of CBM. And they have lotsa people
who continue making new soft for c64 and they fill find about the
fact that all old soft is pd.

: kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu Got a new .plan!

You've got terrific .plan. And say hi to your gal. May be i am interested
in seing HER gif ? hehehe ...

CAN ANYONE GIMME A REALLY GOOD REASON WHY ATARI SOFT CANNOT BE PUBLIC DOMAIN?

Post your opinios here. Do not reply by email. I will post
all email replies here w/o any notification. C ya ...

>level, though...
>

Not just nicer looking programs, though. More complicated
programs become somewhat more efficient when written on the 6809
because of the ease and efficiency with which 16 bit values can be
manipulated. Small tight loops are more efficient on the 6502,
while code manipulating tables of data, for example, can become
more efficient on the 6809.

In defense of the Z80/8080/Intel line of CPUs, one cannot simply
compare clock rates in comparing microprocessors. It would be
more approriate to compare memory cycle times, which on the
6800/6502/6809 family is the same as the clock rate, but on the
Intel line is 1/4 the clock rate. To compare a Z80 to a 6502 or
6809 one need to compare a 4 MHz Z80 with a 1 MHz 6502 ... or in
the case of the Atari, where the effective clock rate is something
like 1.3 or 1.4 MHz, the comparison would be with a 5.4 MHz Z80.

Hey folks, i picked up an anari XE os called BW-dos version
1.00. The docs say that this is pretty much compatable with sparta dos. i
was wondering, how come ive never heard much about this OS on this
usegroup? is there somehting flakey about it?

hmmm...

Look in the Emulators/ directory in the atari directory at
atari.archive.umich.edu. The ST xformer is called: stxf255.lzh

From memory it's not so hot, but that was a long time ago when I tried it.

You say you have some xfd and atr files you want to transfer to
an atari from your 486 so you can run the files on your atari....
hmmmmm.... well why don't you download pc xformer 2.5 or something
because xfd and atr files run on a pc thru xformer not an atari.
I'm an old timer and really don't see what a big deal all this
sio2pc is anyway, All you got to do is hook up a null cable. I made
one by going from COM2 port (9pin) on the pc w/9 pin cable to 9pin/25pin
adaptor to null adaptor (from Radio shack $5) to atari modem cable to
MIO or BB or P:R: connect. The run your Bobterm half duplex, 19200bps
and your pc at the same thing o

and don't forget to config your modem port on the pc to 19200bps and half
dpx on com2. I use Telix for windows and Qmodem on the pc. Works
flawlessly. Cost aprox. $20 total.

$.02; the first time I met Bill in person I said something to the effect of "You know I'm a great admirer of yours" & he just blew it off. I remember not wanting to let it go so I cited 1/6 dozen programmers that had made it onto mainstream platforms, like the IBM, & had given him credit teaching them the rudiments of good programming. His answer was, "Did you know that OSS was programming for the Apple platform before the Atari?" It took me awhile to figure out what he was trying to say, but in hindsight. It was just business & don't transfer affection you may have for a platform to me. I sincerely believe that Bill never sought the status he recieved & didn't care when he got drafted into the spot. In knowing him off & on in the user group, on Compuserve, whatever, he never used his status to try & pull rank to bully someone in an argument. Matter of fact, he never even ack'd his status. Odd, but I guess I rate humility higher then clever retorts. The people that are left, Mike Hohman, Bob Puff, & maybe Klass <J. King! we need a report!> are not making enough money to lead what would be considered a normal life by the mainstream population. Bill was about as mainstream as you could get. Wears a suit, house in the burbs, couple of kids in college, can function working in a real 9-5 job. I been by FTE & I can't see/wouldn't ask Bill to make the same sacrifices Mike does just to stay in the Atari world. Hell, I'd bet <Yeah we know, you don't take bets> Mike doesn't even own a suit. I know for a fact that Bill stayed with the 8 bit to long. Under the circumstances, I can see why he doesn't have a lot of time for looking back. Look at the bright side, he transfered all his products to ICD & from there they went to FTE. The only other vendor that bothered was Supra tranfering their HD interface to Klass. Where's Indus, ATR, or any of the other suppliers? Would have been nice to at least see them make the effort.
Well, I'm getting a little to far off the beaten track. Now that I think about it, I can't recall why I think Bill has more then one kid???
Just a suggestion: It's been great having J. Harris around, why not invite some of the other former movers & shakers to drop in. If a large portion of them do come by we'd be none the worse for it.

The MIO II is from Fine Tooned Engineering, the company which bought the rights
to the ICD/OSS and Newell product lines. The MIO II will be an IDE hard disk
interface for the PBI / ECI on a 600xl, 800xl or 130xe. Rumours have it
supporting extended memory for the Sweet 16 65816 CPU board as well, along
with a parallel port. The price has gone up to $119.95. Mike of FTe
went to a user group in Frenso last week, and I'm expecting a report soon.
Once I get it, I'll post it to the group.

Dave

Rich, congrats on the ATR. I've had trouble using anything above 720k
on my ATR, but I have heard somebody say they used a 1.2 meg drive &
formatted it to the 8" drive 77 track double sided ~1meg. I've only
tried doing this with 1.4 meg drives myself & haven't had any luck.
Sometimes I'd get what looked like a good format, but as soon as I used
more then about 600k<?> of the disk I would get write errors. A problem
with the ATR seems to be it has certain legal formats built into ROM.
For example, I don't think it will do enhanced density. From the lit I
gather it can do CPM formats, but it seems like these only work when
you are in CP/M mode. When I stuck an IBM disk in mine, it could read
the 512 byte sectors but still expected 18 sectors/track. Nice beast
though. It may be the 1797 controller is just not up to higher densities.

JOE! The thing IS, SIO2PC lets you have up to 16MB of files available at ONE TIME. Not 88K or 127K or 180K or 192K or whatever amount of real disk drives and RAM disks you have, but 16MB.. oh wait.. sorry! 16MB PER disk image! So if you had four 360K floppies, four 16MB SIO2PC drives, and a 4MB RAMdisk, that's almost 70MB right there! If you already have a PC, it's MUCH cheaper than a Black Box and if you, say, only had one or two 1050's and a 256K machine (like I do), then SIO2PC gives you seemingly infinite space! :)

The Atari 8-bit Hardware Upgrade and Modification FAQ
=====================================================

| | |
| | |
/ | \

Version 0.0

Dated January 31, 1995

Maintained by: David A. Paterson
Mailto:d.paterson2@genie.geis.com

INTRODUCTION

This is a very basic version. I intend to add as people
give feedback to what they want to see, and how they want to see
it. Any info you have is more than welcome!

PURPOSE

This FAQ exists to describe the various hardware
modifications available to the Atari 8-bit user. It does not
teach you how to do them. It definitely doesn't take any
responsibility for the results if you do try them. But it will
try to give you some information about where to find more
information, which upgrades (or "hacks") are best, and who to
consult if things go wrong. For addresses and phone numbers of
any of the companies listed, consult the Vendors and Developers
List, posted at or about the 15th of each month.

POSTING FREQUENCY

This FAQ is posted whenever I remember to post it. It is
posted to comp.sys.atari.8bit.

PART I - RAM Upgrades

General

The 6502 microprocessor at the heart of every Atari 8-bit has a sixteen bit wide address bus. What this means is that it can access up to 2^16 memory locations. That's 65536 bytes. Some people, wanting more memory, came up with a variety of techniques to use more memory. Most were built around the idea of bank switching. Bank switching means that you swap chunks of memory around so that the CPU can see them when necessary. Most schemes use 16k banks, though 4k and 32k have also been tried.

Atari 400

The original Atari 400 had either 8k or 16k. Atari produced a board with 48k. Mosaic produced a 32k board, as well as a 64k board with 48k RAM plus 4 4k RAM banks. (ANL 13, IFC)

Atari 800

The Atari 800 came with three memory slots. Each slot could contain Atari 8k or 16k RAM boards. Mosaic produced 32k and 64k boards. Three 64k boards could be combined for 192k.

Axlon produced the 128k RAMdisk board. It banks 16k, using $CFFF as a control register. Banked memory appears from $4000 to $7FFF.

Magna systems produced 256k, 512k and 1M boards which followed the Axlon standard. (ANL 65, 68)

Atari 1200xl

See 800xl.

Atari 600xl

As shipped, the Atari 600xl came with 16k RAM. Atari released the 1064 memory module which expanded the 600xl to 64k. MPP, now Supra, produced the Microram 64k Memory Board (ANL 19, 28)

Richard Gore produced the Yorky, a 256k board which plugs in to the PBI. It is for use on 600xls upgraded internally to 64k.

(AC 3/2, 10)

Atari 800xl

The Atari 800xl came with 64k RAM internal. To access RAM hidden under the OS ROMs, the PIA chip was used (PORTB, used for STICK(2) and (3) on the original 800). Claus Bucholtz published plans for a 256k upgrade which banked 32k at a time using PORTB for control in Byte magazine. (Byte Sept 85)

ICD released the RAMBO upgrade, providing 256k in 16k banks, using PORTB. Newell came out with the 256k XL, which would work on a 1200xl or 800xl, providing 256k total memory, . The two upgrades used different sequences to access their banks. (ANL 44, 115)

Newell released 1Meg and 4Meg upgrades for the 800xl. These banked 16k as well, and required disabling internal BASIC to properly access the memory.

Fine Tooned Engineering, having bought the rights to ICD and Newell's products, is bringing out a third method in the Mars 8. Though not yet released, it will use SIMMs for 256k, 1Meg or 4Meg RAM.

Atari 130xe

The 130xe was the first "official" method of banking memory. It too used PORTB, but with an added twist: ANTIC and the CPU could access different banks. This provided headaches for some owners of "older" upgrades, but few programs took advantage of this feature (SpartaDos Wedge and VideoBlitz demo only). Upgrades for the 130xe include replacing one set of 64k chips with 256k chips, raising the RAM to 320k. Adding another 256k for 576k total has also been done.

PART II - Video

Upgrades

The most common video upgrades are the SuperVideo series, described in AC 2/6. Plans were provided for the 600xl, 800xl, 1200xl and 130xe. The SuperVideo upgrade provides the forgotten chroma signal on the monitor port. It corrects a number of errors in the parts in the Atari video circuit, resulting in a clearer image, particularly on monitors.

Providing TTL output was also covered in AC 2/6. Bob Woolley provided plans for the circuit, as well as instructions for getting TTL output from an XEP80. Be warned that the output is not in the standard Atari colours; on a CGA type screen, the sixteen possible shades are translated into eight colours.

80 column devices

Since the 400/800 were released in 1979, people have been clamouring for better text displays than the default 40x24. Two products were released for the 800: The Austin-Franklin 80 column board and the Bit 3 80 column board were both for use in the Atari 800. They replaced the third memory module. The Austin-Franklin board came with a "Right Cartridge" which provided the drivers. Removing the cartridge disabled the board. Some game software would not run with an 80-column board installed.

Ace 80/80xl was a cartridge released which provided 80 columns by using bitmapped graphics on an 80 column screen. A similar technique was used in the Newell Omniview, an add-on for their Omnimon.

Atari's entry into the 80 column field was the much maligned XEP80. For maximum compatibility, the XEP80 attaches to the computer via a joystick port. It includes three character sets, 8k internally, and a parallel printer port. The software provided by Atari supports a 320x200 graphics mode. This mode only supports direct bit images.

Genlock

In October and November of 1991, Michael St Pierre published articles in the SLCC Journal describing plans for a monochrome Genlock. A genlock is a system to synchronize live video with a computer image. Graphics can be overlaid, faded in or out, or used for titling.

In 1994, Michael announced Prism Studio, a full colour genlock. It is sold by Mytek.

PART III - Operating Systems

Computer OS
-------- --

400/800 Rev A. No self test; Memo Pad mode.
Rev B. Fixes several bugs in Rev A.

1200xl XL OS. Some incompatibilities with 400/800 OS

600xl/800xl Revised XL OS. Includes parallel bus handlers. Internal BASIC.

65xe/130xe Revised XL OS. (as above)

xegs Modified XL OS. Self-test mode changed. Internal Missile Command and BASIC.

Operating System upgrades

UltraSpeed + OS : from CSS. Supports high speed disk communication. Drives 1 through 9. Any RAM upgrade. Includes three modes: standard xl/xe OS; 400/800 OS; UltraSpeed+ OS. For

XL/XE systems.

Omnimon: from Newell. M/l monitor for 400/800. Installs into $C000 page of memory, otherwise unused.

RAMROD OS: from Newell. Replacement for 400/800. Includes accelerated floating point math package.

RAMROD XL: from Newell. OS speed-up routines, fast math, and Omnimon. Includes option for second OS.

XL Boss: from Allen Macroware. OS replacement for XL model computers. Includes m/l monitor. 400/800 OS compatible.

PART IV - Other Neat Stuff

Zucchini

In ANL 59,60 and 62, Dr. Lee S. Brilliant provided plans and software to turn a surplus Atari into a printer buffer for another Atari. He called it "The Atari Zucchini".

The Printer Buffer Routine (PBR) and Disk Emulator Routine (DER) came from B.L. Enterprises. They were cartridges and cables which worked in a similar fashion to the Zucchini. The PBR provided a buffer, while the DER emulated a disk drive on the remote computer. Stock XLs gave 403 free sectors; a 130xe would give 914. (ANL 65, 67)

Voice Master

Covox sold the Voice Master and Voice Master junior. These would capture and record speech. Bundled software attempted recognition of commands, with limited success. (ANL 47, 44)

Parrot

The Parrot was a sound digitizer sold by Alpha Systems. Resembling a paddle, the device had phono jack for input. Antic provided plans for a similar project, called the Antic Sampling Processor. (ANT ???)

Gumby

Chuck Steinman of DataQue created this set of plans for building stereo sound by installing a second Pokey chip (Pokey and Gumby, get it?). Once installed, the second channel has all its addresses 16 bytes higher in memory ($D210 - $D21F)

Critical Connection

A long time ago, in a galaxy far, far away, was a mystic operating system known as CPM. A company named USS Enterprises produced the Critical Connection, a device to permit a CPM computer to emulate disk drives for the Atari. It was a cable,

plus software for the CPM end of the system. The CPM system could also act as a printer buffer, and the CPM keyboard could be used in the place of the Atari keyboard. (ANL 39,103)

SIO2PC

With the demise of CPM and the rise of the IMI cartel (IBM-Microsoft-Intel) a new system similar to the Critical Connection arose. Nick Kennedy developed the SIO2PC hardware and software, which permits any PC with a serial port to act as up to four disk drives for an Atari. It can also act as a printer buffer.

Computer Eyes

Computer Eyes was a video capture system which plugged into two joystick ports. It could render images in a variety of modes. It required a composite video source. (ANL 35, 53)

Turbo 816

Released by DataQue, this provided a replacement OS as well as a replacement for the 6502 CPU. A 65816 was substituted, providing new opcodes and a 24 bit address space (16Megs vs 64k with the 6502).

Sweet 16

Released by Fine Tooned Engineering, this provides a 65816 CPU to replace the 6502.

MIDIMATE

MIDI stands for Musical Instrument Digital Interface. It is a system for computers to record, replay and control musical instruments. MIDIMATE, when combined with MidiTrack software, permits an Atari 8-bit to take control. (ANL 33, 26)

MicroNet

Supra provided the Atari community with its first networking product. MicroNet provides nine SIO connectors. Eight are for computers. The ninth goes to whatever peripherals are to be connected. The system served to isolate the computers electrically. It did no software checking, meaning that two or more users attempting to print or save at the same time could trash each others output. (ANL 51, 76)

MultiPlexer

CSS provided a better way to network. The Multiplexer system requires one host system which has all the disk drives and printers for the network. The slaves are connected via the cartridge port to the host, and all their disk and printer i/o is rerouted to the host. All the systems involved require their OS

replaced with a special multiplexer OS.

MIO

ICD manufactured this wonderboard in 1987. Connected to the PBI or ECI, it provided either 256k or 1Meg of RAM, two RS232 ports, a parallel printer port and a SCSI hard drive port.

MIO II

Currently under development by Fine Tooned Engineering, this PBI/ECI board will provide an interface and power supply for an IDE hard disk. It may also include extended memory support for CPU upgraded computers, as well as a parallel port.

Black Box

CSS manufactures the Black Box, a PBI/ECI device that offers an optional 64k printer buffer. Its main attractions are its m/l monitor, 19200 baud RS232 port, parallel port, and hard disk interface.

Floppy Board

This is an add-on to the Black Box, also from CSS. It permits standard floppy drives, 360k, 720k, 1.2M and 1.44M, to be attached to the Black Box. Since they are connected to the PBI, these drives operate extremely quickly.

R-Time 8

This is a clock cartridge for any Atari from Fine Tooned Engineering. It includes a pass-through connector so that any other cartridge can be plugged in as well. Though primarily intended for SpartaDos, software for other DOSes is included.

Mars-8

This is still under development from Fine Tooned Engineering. For 800xls only. Memory expansion of 256k, 1M or 4M. Install internally Action, Basic XL/XE, MAC/65, SpartaDos X, R-Time 8.

=== End ===

I can't imagine this. I've had a closer look to ATARI DOS 3 yesterday and it
seems that it's very similar to MS-DOS (using cluster, hold the free sectors
similar to DOS - looks like an 8-bit fat 8-) .
So it's possible I think !
>There is also the issue of copyright. I don't know how Atari's ST got
>away with its MS-DOS ripoff filesystem.

I think this is the last problem to care !!!
Do you think that Bill Gates have a closer look to the ATARI 8-bit scene ?
I think nobody cares what some crazy freaks will do on 8-bit machines !!!

Matt

>1.00. The docs say that this is pretty much compatable with sparta dos. i
>was wondering, how come ive never heard much about this OS on this
>usegroup? is there somehting flakey about it?

>hmmm...

Yes you're right. The ABBUC in Germany gave his members this DOS last year
as gift (there are one or two gifts every year).
It supports the SpartaDos Filesystem and will work properly with all
SpartaDos disks and with most of the Utilities.
But it don't use the background RAM from $c000 till $FFFF.
It also didn't support the old Dos 2.0 filesystem, but you will get a copy
tool called menu - it's exellent and much better than the Sparta-Copy tools
like MENU or XCOPY (a little Norten-Commander 8-).
A special feature is the DOS path.
If the DOS is looking for an external command, he will not only look in the
current directory, but also in the Dos-Path.

Matt

>though. It may be the 1797 controller is just not up to higher densities.

Nothing in the controller would prevent any of the Atari format
combinations. There is a procedure and some information in the
ATR8000 documentation about setting up and installing new formats
so that the CP/M system recognizes them (and I assume the Atari
disk drive emulator runs under CP/M). I just got mine last week,
and have not as yet even hooked it up, but intend to real soon
(like next two weeks). Once I do, first on the agenda is
disassembling all the software to help figure out how the hardware
works. There is a good chance that the hardware can limit the
usage of 1.4 M 3.5 inch drives by not having the right clock rate
available ... 8 inch drives (and some 5 inch 1.2M drives) rotate
at 360 RPM, while normal 5 inch and most (if not all) 3.5 inch
drive rotate at 300 RPM. So it is quite possible that the clock
frequency used for writing 8 inch drives is not a good one to use
for 1.4 M 3.5 inch drives. It is also quite possible that the
software uses the rotational rate in selecting drive format on the
fly, hence tying a spcific clock rate to a specific drive
size/rotation rate.

Anyone know the exact format of a 1050 disk's VTOC?
Specifically, where's the rest of the volume bit map?

Thanks in advance for any help!

P.S. For that matter, what are the formats used by the 180K SS/DD
drives?

Apart from that, Zeppelin recently ceased to exist. They were
swallowed up by a large US firm for $2.2 million.

> used a 1200XL.

I've only ever used 800XL machines and currently own two of the
suckers. My old machine's keyboard is, well - let's not mince words -
crap!! I recently bought the second XL and was amazed at the feel of
the keyboard. It doesn't rattle as much as the old machine, isn't as
squishy and is therefore a joy to use, especially when typing in long
programs.

> > This makes me think of something I have been wonderin about for

I think the 600XL did fairly well over here, but was killed off when
the price of an 800XL started to plummet. I've never seen a 600XL 'in
the flesh' either. All my friends had an 800XL, apart from one who
had the original 800.

The Winter 1995 wrote Michael Current following stuff...:

MC> For those of you who clearly don't use my vendor/developer list, why
MC> not? Honest responses appreciated.

This is honest. I think its great. If there wasnt a dev/vendor list I shure woldnt use my XE for anything else then some games. Now I dont have time for one single game anymore.

I bought the XE 1986 and the ST 1 year later and I learnd to use the XE for something else then games for 2 years ago only and I use it 50% of my Computer time. And the biggest reason of this is your list mate.

: saying (something like) 'get a real computer'. We here

I never said "get a real computer", this is what you said. You thought
I was saying this but I wasnt.

I am saying that Bill Wilkinson is a nice guy and he did a lot for the
Atari 8-bit line and I dont like to see someone going off on him when he
has moved on.

However, I nobody should be blasted just because they went on to a new
platform. I read a lot of messages from Glenn and he always bitches and
moans on how bad Intel and the compatables are and he bitches because his
platforms are not as popular and how he thinks that that platform is sad
or doomed and then he has the nerve to go off on bill and say stuff
against him for going to the Intel platform.

Its ATARI/AMIGA/68xxxx advocates that are so biased they cannot see
through their nose. I used to have an Atari 8-bit and I like to keep up
with different things, but I cant stand so many people being so biased,
its a freaking religion.

I like Bill and I thank him for all the good memories that I have on my
trusty ole 8-bit, and that there are new horizons out there for us to
explore and we shouldnt be so short or simple minded to think that other
platforms are sad and anyone that goes to those platforms are sad as
well. I do resent this attitude!

> The ST Xformer
>cable I have is just [any Atari disk drive]=ST printer port, but my hunch is
>Derek will support (if he doesn't already) the same cable on the IBM.

Tell me if any of this is wrong:
1 - The ST-Xformer cable connects an 8-bit disk drive (such as the 1050)
to an ST through the ST's printer port.
2 - The ST's printer port is a standard parallel port, as seen on the PCs
found among the more depraved people who hang out here. ;-)
3 - The ST-Xformer software supports the ST-Xformer cable.
4 - The ST-Xformer software does not run on the aforementioned PCs
(ignore Gemulator for the moment)
5 - PC-Xformer does run on said PCs
6 - PC-Xformer does not support the ST-Xformer cable

OK, if all that is correct (and I'm especially not sure about #2), why
can't we write a program to run on the PC's that will support the
ST-Xformer cable for file transfers?

If the ST doesn't use a standard parallel port, I still think the
cable could be modified to connect with one.

Funny how a given event has totally different impacts on different
people. I would look and say to myself "Oh God! 53 new messages!
Argh!"

Regrettably, an increase in the number of people participating in any
newsgroup seems only to decrease the signal-to-noise (S/N) ratio.
(Just check the rec.arts.startrek.* hierarchy.) When I first
started reading this newsgroup four or five years ago the great
majority of posted articles contained some little tidbit of
information that had never been gleaned from other sources. Tips on
configuring particular software packages. How to fix a 1027.
Troubleshooting drive problems.

Now, the conversation seems to dwell on things like programmer's
sexual preferences (as if it matters), piracy (not again!), and
massive auctions. That's not to say that there isn't a lot of good
information still floating around out there. We need more people with
Bill Kendrick's enthusiasm. Michael Current's FAQs are a life-line in
our ever-shrinking market. The real problem is that it's getting
much harder to separate the wheat from the chaff.

I have never been a big poster on this group, but now I'm basically a
full-time lurker. I find it more and more difficult to keep up my
enthusiasm for this group (and, to be blunt, it's because of the
banality of many of the discussions) and, as a result, hardly post
anymore.

There are other people who had a major impact on this group not too
long ago, and they've basically disappeared. Two that spring quickly
to mind are Ben Poehland and Jeff McWilliams. There are others. I
won't speak for them but one can perhaps assume that the reason we
don't hear from them anymore is that they've lost interest in the
group. Not with the hardware, but with this newsgroup.

I know some of you will disagree with me. I did not post this with the intention of it being flame-bait. If you take exception with what I've said and want to continue the discussion let's take it to email. God knows we don't need any more noise in the group.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <132073@cup.portal.com>
Source record: 94991

I have a copy of Wooley's sim upgrade around here somewhere. But no matter.
Did you specifically want to build something rather then buy it? Reason I
ask is because that's what I mainly use my Atari for. I've done piggybacked
PIA to printer & PBI/PIA to printer. I've also just added an 8 bit latch/flip
flop to a cartridge <74LS374> for my own reasons. It got real tedious making
it into a through cart so I could plug external carts into it, probably 20'
of wire wrap, but the thing is solid. If you just want something simple you
can use with the xl's built in basic, can just use 7 data bits & one bit to
strobe the printer, I can do it in two chips. If you want something a little
more sofisticated, like a PIA in a cart, I can do that also. The thing about
the cart that makes it slightly attractive is it already has a hardware !CS
line comming out for any R/!W to the $D500 area, ditto for piggybacking chips
inside the computer, all 8 !CS lines are there so you don't have to do any
decoding. The PBI is really nice, but it takes an extra couple of chips to
do the decoding, no problem, but I hate wire wrapping so I go as few pins as
possible. Hmmmm, SOPH above!
If really want to use a PLD, how were you going to go from logic to a device?
Reason I ask is 1) I'm completely ignorant on the language they use
2) I don't have a device programer
3) The ones I've seen let you use predefined devices like a 74LS374 in your
design & translate it to logic from there.
For instance, if I told you a 74ls02, 74ls138, & a 74ls374 & gave you a
connection list, everything is done automatically.
I am kind of luke warm interested in this if you do it. I'm to old/lazy to
learn how to use the things/programs myself, but if you are serious about
making a handfull of these things & shipping same to me, the 5' of wire
wrap it would save me per design would heat up my interest.
Rick

854. ST Xformer

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-31 18:41:18 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <B29AA24153A@east-01.novell.leeds.ac.uk>
Source record: 94988

Does anybody know if the ST Xformer software and cable will allow
files to be transferred from ST to 8bit as well as 8bit to ST?

I basically need to read and write 3.5" PC/ST disks so I can down and
upload stuff from and to the archives. Using Util etc is no use to me
as the PCs I use for e-mail etc do not have 5.25" drives installed.

I own an ST and 8bit and I use a PC (at work!) to e-mail download etc.
I could use a CSS XF Dual drive upgrade but that would only allow me
to read ST/PC disks, fine for downloading but not so hot for
uploading! Any suggestions without going out and buying a BB and FB?

Thanks

RICHARD GORE

I just thought I'd let 'Artem' know that I am a commercial software vendor and I would mind if you pirated my software and if people uploaded it to PD FTP sites etc.

Fortunately I think that most of the people on the 8bit 'Net' now respect copyrights and commercial software. Artem appears to have a very narrow minded view of how he wants things to be with complete disregard to what the law says is legal. These kind of people really make me mad, here we are struggling for survival and we still have people who insist on pirating software. I just hope the law catches up with those responsible.

RICHARD GORE

Only display them in circumstances when a PC would display them. I'm
not quite sure what those are, though. I think it's analogous to the
fact that you can only see the inverse-esc character (155) on an Atari
when you write directly to the screen; otherwise you just get a
carriage return.

862. Toad Computers Internet Support

Newsgroup: comp.sys.atari.8bit
Date: 1995-01-31 19:27:55 UTC
From: "Toad Computers, Inc." <toad@charm.net>
Message-ID: <3gm2vr$ht5@canton.charm.net>
Source record: 94907
Cross-posted to: abg.atari,comp.sys.atari.8bit

```
TOAD COMPUTERS ANNOUNCES INTERNET SUPPORT SERVICES 01/31/95
-----------------------------------------------------------------------
```

Toad Computers is proud to announce online support on the Internet, including a World Wide Web (WWW) homepage, an ftp site, and e-mail for sales and technical support.

The World Wide Web homepage allows customers to get product information (like Jaguar game screenshots and availability dates), request a catalog, learn more about Toad Computers, and view Atari-related graphics and animations. Right now, the Toad Homepage even allows online ordering of some products, like clearance games.

In addition to resources specific to Toad Computers, the Toad Homepage offers pointers (or hypertext 'hotlinks' as they are called), to other Atari-related resources on the Internet including software archives, newsgroups, and other Atari-oriented WWW homepages.

"We believe that the Internet is an important new medium," says Dave Troy of Toad Computers, "and if it helps us to provide better service to our customers, we want to be a part of it." While there is no graphical 'Mosaic'-type WWW browser for the Atari, Toad Computers is very interested in seeing one developed. According to Dave Troy, "Hypertext Markup Language (HTML), the raw text underlying the Web, is extremely straightforward. The tricky part of getting Web access on the Atari is the TCP/IP connection that PC's can get using a program like Trumpet Winsock. Once a PPP (point-to-point protocol) connection can be made reliable, a web browser should be fairly easy to implement." Right now, there are a few packages (such as KA9Q/NOS/STNET/MintNet) which deliver PPP access on the Atari, and ZFC (the makers of Edith Professional) have been talking about writing a graphical browser. It is likely that before the end of the year, software should be available to allow Atari PPP and WWW access through a variety of local Internet access providers.

For now, to access the WWW homepage, Atari users will have to use Internetworked PC's or Mac's equipped with a 'Mosaic'-type browser. In addition, America Online (also accessible through Mac's and PC's), will be offering graphical WWW access this winter. "It shouldn't be too hard for someone to find a Mac or PC running Mosaic. Many Atari users use these systems at work, and they can also be found on just about any school campus -- from university to community college, everyone is running Mosaic!," says Troy.

An ftp site is also available for Atari users to download files that pertain to Toad Computers, such as our SYSINFO system & modem tester, STraight FAX! support notes, and ordering information. Right now, CompuServe, America Online, and GEnie all offer limited FTP access, so users of these services should have no problem accessing this site. And of course, any machine on the Internet can be used to access this site using a conventional ftp client. The KA9Q PPP package for the Atari includes a built-in ftp client.

Toad Computers has always been available through e-mail, but Internet e-mail allows greater flexibility and faster response times. "With our e-mail on GEnie, it has always been a project to read it and respond quickly," says Troy, "and that has been particularly true with the huge volume of mail we received after mailing our most recent catalog."

If you have sent e-mail to the 'toad@genie.geis.com' address, please be patient; it will be answered. However, for an immediate response, please direct all e-mail to our new address, 'toad@charm.net'.

Toad Computers does not plan to stop visiting the Atari ST/Jaguar Roundtable on GEnie. "GEnie has always been a core part of our online support, and we appreciate the relationship we have developed with customers and developers there. We will continue to post specials and news files on GEnie, and we will also continue to be involved in the Bulletin Board areas," says Troy. And of course, any e-mail received at 'toad@genie.geis.com' will be answered. However, customers are once again reminded that response will be faster if e-mail is sent to 'toad@charm.net'.

Toad Computers Internet addresses are as follows:

WWW Page: http://www.charm.net/~toad/

Anonymous FTP Site: ftp://ftp.charm.net/pub/home/toad/
(ftp to ftp.charm.net,
go to pub/home/toad directory)

E-Mail: toad@charm.net

E-mail from GEnie: toad@charm.net@INET#
(@INET# instructs GEnie to use
their Internet e-mail gateway)

For more information, Toad Computers may be reached by mail, telephone, or FAX as well.

Somebody dug their 130xe and carts out and they don't work. I suggest
using an eraser and isopropyl alcohol to clean the contacts on those
carts. They've probably got a pretty thick layer of oxidation on them
by now. I really suspect there is nothing wrong with the 130xe, since
the READY prompt comes up with no cart in.

First of all there are still Atari BBS's out there with TONS
of pirated code. So... technically, the software is already out there...
it is just not easily available to you.

Secondly, yes... all software is copyrighted and thus is illegal to
copy for such large distribution purposes.

Thirdly, yes, I do own tons of pirated stuff. It keeps me very
interested in the Atari's knowing I will never be able to own
every single program written for the darn thing even if the
atari archive suddenly went pirate over night.

I however do not release any of the software to other people unless
it meets the following criteria:

1) IT IS NOT AVAILABLE FROM A VENDOR. (I have a few catalogs laying
around and always check, if not ask if they sell a certain program)
If its from a vendor, I'll direct the person who is asking for
the program to the vendor. (6 bux for AR stuff is GREAT...In
fact I may just buy a few copies more and give them to my
brothers who also love to play that... they are also collectors
so the word "mint" means something.)

2) IT is a prototype or "buried" cart. In this case I really don't
have any problems in distributing it since its usually Atari's
own fault that the public can't purchase it.

3) Software is rare or common.

I think a list of purchaseable (that word exist?) software should be
made up. And anything not on that list is up for discussion as
to whether or not its immoral or illegal.

: : the MUX!
: :

: er..wouldn't the banking port conflict with the 2 other joystick ports? =)

I think the only way to get software to run off of a PIA2 extra joystick
ports hack is to modify the code to look to PIA2 PORTA rather than PIA1
PORTB. Either that or modify all banking software to use PIA2 PORTA and
wire the upgrade through PORTA. Not easy any way you cut it.

Mere mortal Rob Funk provoked me by writing:

: I doubt the disk format even can be copyrighted. There have been many
: non-MS-DOS systems to use the same format.

Yes, but in 1985, the same year Atari Corp decided to go with an MS-DOS FMS clone, the issue may have been a little more ambiguous, enough to affect ICD's decisionmaking. Of course, in 1985, MS-DOS compatibility was not quite as much an issue because other platforms besides the clones were still considered 'viable' unlike today.

Mere mortal Rob Funk provoked me by writing:

: Only display them in circumstances when a PC would display them. I'm
: not quite sure what those are, though. I think it's analogous to the
: fact that you can only see the inverse-esc character (155) on an Atari
: when you write directly to the screen; otherwise you just get a
: carriage return.

Atari character graphics that are normally cursor commands can all be seen remotely by preceding the graphics with an escape. This is how many online ATASCII graphics and animations get some of their characters to work right.

Unfortunatly sometimes the BBS core strips out these characters.

>when he got drafted into the spot. In knowing him off & on in the user group,

My 12th grade English Lit instructor was the same type of person.
I saw him again in college one time (we were both involved in the same
seminar once), and wanted to thank him for all he'd done, and express as
best I could exactly how much of an impact his instruction had on my
life. He pretty much blew it off (albeit in a friendly manner). I was
rather shaken by that at the time.
A few years later, I looked back on that still puzzling about it,
then I figured out that he didn't want thanks, that perhaps he got all
the satisfaction he wanted from his work while on the job. Perhaps it
embarrassed him. I don't know.
How does this relate? Well, I am just saying that there are many
people out in the world who have a tremendous influence on people's lives.
Some, like many popular culture icons, revel in it (some even have the
audacity to charge for autographs). Others, like my English Lit
instructor and Bill Wilkinson, prefer not to have the adoration of the
people they influenced in such a positive way.
I am with you in respecting the latter group more than the
former.:)

-Joe

heh, the helmet is called the VICTORMAXX STUNTMASTER. it was made
for the sega genesis system and the SNES <thats super nintendo
entertainment system. youve never heard of that?? god god!> Anyways i
picked up this helmet for about $65. This item was in stores and sold for
about $150 dollars or so, but it didnt sell very well. in fact i had to
get mine out of some catalog.

The helmet came with 2 adapters. one for the SNES and one for the
SEGA. I botherd some people on the SEGA usegroup until somoen finally
mailed me the pinouts for the sega AV port. it had both RGB and composite
outputs. I then went to my local spare-parts store and bought an female
adapter that is like the one on the sega, and solderd wires comeing off
the composite and audio pins, and connected them to standard RCA jacks.
Reason i did this was so i could watch TV through the helmet. :)

Anyways, the helmet itself is not really very exciteing. its basically a color LCD screen with flat magnigiers a few inces from it, and from your nose, to give the illusion of stereoscopic vision. in short, its a bit like looking at a sega GAME GEAR screen. for use on the sega system, the resolution is not really that good so ya miss tiny objects. but for watching television and playing fairly simple games like MEGABLAST, its cool. :P

Anyways they are comeing out with better versions of el cheapo VR helmets. i read about one in some gamers review that sounds kinda neat, and the CDrom store near me sells the new CYBERMAX VR helmet that hooks up to the VGA port on a IBM...but thats another subjects for another usegroup. :)

Don't tell me you know Z80 assembler also<g>. That be one of the platforms I should'a learnt, but never did. I think I know what you mean about the floppy controler, but what I meant was: If you do a format when it's hooked up as an Atari disk drive, it only has a couple of legal combinations you can give it. i.e. single or double density, single or double sided, tracks [40, 77, 80]. Even if you give it a legal combination for the drive, it seems to insist on selecting one of the legal formats in ROM for drives that existed when it was designed. Did you get the CP/M software that comes with it? Mine didn't have it & I've found someone that well sell me the a disk with CP/M as well as some other utilities. It always seemed like a waste to have 64k setting there without some kind of track buffering or something, but I think my window of oppertunity is closing on Z80 code.

: -bill!
: kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu Got a new .plan!
: William (Bill) Kendrick / | \ ** New Breed Software **

hmm..was it 'worth' it? thats something i must muse over for
awhile. :P

Actually the victor maxx plugs into the segas joystic port, and
since that is basically the same as the ataris port, i tried that out.
What the helmet has is sort of a stick that pokes out the side of the
hemet and cips on to your shoulder, so when you turn your head left or
right, the controller goes left or right. So what i ended up doing was
holding the fire button in my hand, and to move my head from side to
side. in effect, it was like 'rocking' my head to one side, and the
little spceship with 'slide' in the direction i rocked my head.

HOWEVIER since i rock my head to the side, the who screen moves
<its in the helmet after all> so just the SPCESHIP moves but the screen
doesent. in short, by level 13 i was feeling sorta sick and had to pull
it off and wander outside and have a beer.

actually, its not like looking at a 6 foot screen right away, ya
gotta wear it for awhile and let the illusion come that its a 6 foot
screen. after all in the helmet all you can see is the screen, and
nothing else to compare its size with. <shrug>

lates!

Unfortunately, I don't have a clone faster then a 386 so I'll never know what goes on for sure. In regards to #2, nothing. I always assume that everybody is as busy as me so since I expect Derek will write the program, I don't want to duplicate the effort. I'm really only vaguely up on the ST printer port, but the info I have shows it only has 8 data bits, one strobe, & one input for printer busy or fault or whatever. I believe the IBM typically has at least 4 input bits plus all the output so if anything, it may be easier. I guess I could add I think it would be better to use a serial port vs the printer. I wouldn't mind building an interface for that, but I'd never write the software.
Rick

Mere mortal Vladimir Elberg provoked me by writing:

: I like Bill and I thank him for all the good memories that I have on my
: trusty ole 8-bit, and that there are new horizons out there for us to
: explore and we shouldnt be so short or simple minded to think that other
: platforms are sad and anyone that goes to those platforms are sad as
: well. I do resent this attitude!

1) You are being overly sensitive (and I see no reason for clone users to
be sensitive since they are in the driver's seat). Others have good
reasons to be insecure and clone users would be good to keep their mouth
shut and enjoy the benefits of the mainstream.

2) Your resentments are based on false conclusions about what I'm thinking
of. I never said that 'other platforms are sad' nor that 'anyone that
goes to those platforms are sad'. I resent your redefinition of my
mindset which is clearly false and based on a breakdown in communication
in which you read the words but they go out your ear and your insecurities
kick in. I've already tried to assuage your concerns by agreeing that
Bill deserves SOME respect for his prior acheivements but it seems that
the only thing I could do to please you would be to pray to Bill Wilkinson
as Atari8 guru supreme every night which I refuse to do for reasons which
I have every-so-carefully explained. If I have a different basis for
determining who I chose to respect in which order and why. Everyone has
their own personal list of people they respect and different criteria
they use to determine respect and that is as it should be.

But as long as I don't think your way, I've got a problem. I resent
THAT attiude.

I wasn't going to mention that, but since you did....

The solution would have to be to add a second PIA. I have a file
describing that on an Atari disk somewhere.

The problem is software incompatibility. Depending on how you do it,
either the extra sticks aren't recognized by software expecting an
800, or the extra memory isn't handled properly. I'd probably set it
up so the memory was the problem, since there'd be less software to
change.
If you go by my plan of adding stick ports to an XL, you'd probably
need to have an extra POKEY (i.e. GUMBY) in addition to the extra PIA,
so you could have extra paddles too.

PATERSON, DAVID ANDREW (da_pate@pavo.concordia.ca) wrote:
: I'd heard (rumour and innuendo mostly) that IBM considered taking the
: Atari 8-bit for its own, repackaging it as "Big Blue". Does anyone know the
: origin of this tale, its truth (or lack thereof) and any other juicy tidbits?

Way back in issues 52 and 53 of Page 6's New Atari User they published a short series of articles entitled "Eight Bits of History" in which its states something along the lines of:

"When IBM originally decided to enter the personal computer market they at first considered purchasing an already existing firm. To this end IBM set up a committee to find a suitable company. This committee eventually reported back and suggested that they purchased Atari. However, when Frank Carey, IBM's Chairman at the time, asked the committee whether Atari was best they replied no and when asked who was they replied Apple.

Unfortunately, for IBM, although Atari was up for grabs at the time, Apple wasn't, and so IBM developed the PC instead...

Should have bought Atari really, shouldn't they? (Yeah, well!)

You may also be interested to read a book called "The Making of Microsoft" published by Prima Publishing (ISBN 1-55958-071-2) which had a VERY brief mention of IBM's original intentions. (Yawn!)

885. Vladimir Elberg the Intel advocate

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-01 03:45:03 UTC
From: krishna@primenet.com
Message-ID: <3gn03v$1fk@news.primenet.com>
Source record: 94919

This will be the last waste of bandwidth on this petty flamewar issue, plys I'll be off the net for a few weeks or more which I'm sure a lot of people will be happy to hear. I just wanted people to get a taste of the kind of disruptive posting that Vladimir has been doing of late in the Amiga groups. It's often the people who leave a platform who are the least tolerant of the diehards, and as such I have little patience for people like this. If they leave us alone, fine, but when they yammer on about how the sky is falling and how everyone has to join them on the ONE TRUE PATH or face oblivion, I just get seriously pissed off.

I certainly hope that the majority of the posters on this particular newsgroup do not think likewise, at least I should hope they don't at least go so far as to go out of their way to disrupt their old stomping grounds the way Vladimir is doing rather than merely reading and posting about the platform in question.

Anyway, here is a taste:

> THERE ARE MANY SUPRISES AHEAD, MANY OF YOU THINK THAT THE INTEL
>AND COMPATABLES ARE OBSOLETE TECHNOLOGY AND THERE IS NO WAY TO IMPROVE
>THE TECHNOLOGY. YOU ARE WRONG, I HAVE SEEN SOME EXAMPLES OF WHAT IS
>COMMING TO THE PC AND MANY OF YOU WILL BE SHOCKED TO SEE SUCH TECHNOLOGY
>COMMING TO THE PC! I WILL EVEN GO SO FAR TO SAY THAT MANY OF YOU WILL BE

I hear you. I'll admit that I've littered the conference
myself.... I got pissed because I ask simple questions like:

1) Where can I buy low-density disks for my Atari8?
2) Where can I buy 850 modem and printer cables?
3) Where can I find someone to clean/adjust/repair my aging
disk drives?
4) Where can I find someone to upgrade the memory and repair my
XLs and XEs.
5) Where can I find someone to perform the Super Video upgrades?

Honest to God, not a *single* (zilch!) person replied. NOT ONE!!!!!
I'm not asking someone to enter a long-winded post and write a book.
Nobody cares. There was a time when the Atari community felt differently.
It seems to me that these questions are along the lines of your "1027"
example topic.

> Two that spring quickly
> to mind are Ben Poehland and Jeff McWilliams. There are others. I

It was a sad day for me when Ben Poehland gave up Atari Classics.
However, with the way things go on this net, they can't really be blamed
for ducking out of here. Myself? Although the logic may be in question,
I still like to read this base....I keep *hoping* things will improve.

Message-ID: <Pine.SUN.3.91.950201010930.1312I-100000@PEAK.ORG>
Source record: 94933

I got off the phone with Bob Puff today. I must say that despite my inability to contact him with written communication, he is very helpful and friendly on the phone. Some of the prices seem a bit high to me at first, but I don't suppose he makes a large profit at all, and I am glad to have vendors left at all.

1) I'm sending in my Black Box to have it checked out, and 64K buffer added.

2) I'm sending in my 256K 800XL with the bad ROM to have the Ultraspeed Plus OS installed.

3) XF551 #1 gets "The Enhancer" and "The XF Update" installed.

4) XF551 #2 gets "The Single Drive Upgrade" to make it a 3.5" 720K drive that'll do Ultraspeed. I've been wanting a 3.5" on my 8-bit since Atari rumored one in 1985. I'm finally gonna get one!!!

Anybody ever seen the "Dual Drive Upgrade?" That's where he hangs a 3.5" mechanism off your existing XF551. The 551 is D1: and the 3.5" is D2:. In the CSS catalog, there's a picture of an XF551 with the additional 3.5" drive sitting in a PC rail-frame on top of the Xf551. That works great, but it isn't pretty! I think it would be neat to install a DIN plug on the back or side of the 551 so I could accomplish the same thing by plugging in a SF314 drive....the double-sided 720K 3.5" for the Atari ST. Wouldn't that be a neat trick??

>me right to the old self-test). However, without plugging them in, I do
>get the "READY" prompt.
Try this: Take the cartridges and *BLOW* into them a couple of times just
where the edge connector is. If that doesn't work then try blowing a couple
of times into the cartridge port. The other problem with the 130XE is that
having the cart port at the back, cartridges tend to sag. Some of the newer
carts designed for the XE have an edge along the back of the cart which keeps
them the right height. If your carts don't have one of these then try
inserting the carts into the XE and carefully lift them, just slightly. Be
carefull not to break anything. Then switch the XE on. If it doesn't work,
switch off and try again with the cart in a slightly different position.
This is often the cause of the problem. If you find you can get the cart to
work like this, switch off and carefully wedge the cart up with a something,
I find a small rubber (eraser) is often best (doesn't slip) is you can get
one the right height. If none of this works, there's probably something wrong
with your cart port.

Source record: 94936

Of course, INSTR() is not in standard Atari Basic, just Turbobasic or Basic XL/XE. Turbo Basic also has a DIR command, but that doesn't read the directory into variables, it just shows it on screen. And (though it doesn't matter here), TB has a UINSTR() function which works like INSTR but is not case sensitive.

DOS 2.5 puts the bit map in sectors 360 and 721, I think. Mydos uses sectors 360 and 359. 180K disks have 720 sectors like single density disks, only the sectors are bigger. The VTOC is still in sector 360.

The biggest problem with using the MS-DOS file system on an Atari 8-bit is
that the disk drives can't read 512 byte sectors. CSS sells an XF551
upgrade that can read but not write PC disks, and I hear that the Black
Box Floppy Board is capable of reading and writing them.

Since, Bob Puff has made it know that he'll be writing a special R:
handler for the R:P: interface that will support that higher baud
rates, has anyone asked him how exactly those higher baud rates will
be addressed?

I'd call him myself, but I'm kind of in Korea at the moment.

I would really like to have support for the R:P:'s data rates in
FlickerTerm.

I can give you a reason why all Atari 8bit software shouldn't be made public domain, in fact I can give you two;

1) Copyright exists on much of the software and therefore the author is required to release it into the public domain.

2) Some authors don't want there work to be public domain, and we must respect what the authors want. After they have spent many months developing the software they deserve the right to at least try and get some payment for their efforts.

And now for something different;

Printer interface via the PBI, a company called Rambit in the UK devised and sold such a unit. The good news is they are still in business. If you are interested their address is in the vendors/ developers list.

James & anybody else who cares about a useless bit of info. There never was a genuine need to eliminate the extra JS ports & once having done so use those particular bits for banking. WHoops! I mispoke. The engineer that was assigned to do the rework of the system probably had his career riding on shaving $.25 off the price of the computer. Groceries are important & you can genuinely buy them with those funny little things they call paychecks. The Axalon boards used a different scheme that most people liked better, I'd have to look at my board & see if they patented it or something. The OSS Supercart circuitry could be used to perform the same banking functions as the PIA does. It only takes 3 LS chips to do the Supercarts. *IF* Atari would have been willing to assign one of the unused hardware pages to banking you could do 256 16k pages in just two chips. From what I've seen, if they (meaning Atari) would have been willing to throw a PLD at it, it could have been done in a single device.
In spite of the application vs hardware debate that goes on, if people would be interested I could post the connection list here to show just how easy it would have been. Some what academic, but that seems to be what we're about anyway.

Using DOS 2.5, only 1023 sectors are usable in enhanced density. Knock off those used by the system, and you've got about 1010. That's because there's only one sector for the VTOC. MyDos 4.5x uses a dynaimically growing VTOC, so it doesn't have that problem.

On a 180k SS DD disk, there's no such problem. Since there are only 720 sectors, a single sector is enough for the VTOC.

Note that none of this applies to Sparta; I don't know how a Sparta disk is organized. Actually, if anyone has any info, it should probably go to the archive.

Yep, I too suspect that the problem may be with the cartridges themselves
rather than with the 130XE mentioned in a prior post.
Especially when you have those cheap Sega cartridges with no gold coated
contacts. They soon get coated with some sort of oxide when not cleaned
regularly. I've got "Star Trek" which has to be cleaned first before
I can actually play it. Yes, it's made by Sega.

>made up. And anything not on that list is up for discussion as
>to whether or not its immoral or illegal.

A global catalog of all software available from every vendor would be a
tremendous resource, but in all practicality, impossible. The
major vendors always have titles that aren't in their catalogs. The
minor vendors may not even have catalogs. Some vendors make their money
on used software (original disk, original doc's), obviously their stocks
may include most any title at any particular time. Then there's the
problem of coordinating world-wide, if PaperClip is available in Germany
do you give away a pirate copy or do you tell your friend to order it
from the other side of the world?

Having visited Derek Fern of Micro Discount the Uk's largest Atari
8-Bit supplier yesterday I was well impressed. He is a Gentleman.
Having just returned from his holidays he still found 20 minutes to
talk with me about Micro Discount.

The latest version of PC Xformer which is now higher than ver 3.0 is
available from them for 21. They release a frequent catalogue of their
wares for 3.60 all available from the address below. May I also add
that they do mail order for addresses abroad.

Of interest to Uk users is the fact that either March or Aprils issue
of PC Home magazine will have as part of its cover disc
Ver 3.0 of PC Xformer and a load of demo software
+ the latest catalogue all suplied by Micro Discount.

I haven't seen a catalogue yet but Derek told me that they buy up the
rights to as much Atari 8-Bit software as they can with a view to
re-releasing it not only for the 8-bit machines themselves but also in
a ready format for the emulators. They also supply leads for
transfering software from one format to another.

The address is:

Micro Discount
265 Chester Road
Streetly
West Midlands
England
Uk.

Hmm..thought i would just add my thoughts to this thread...

I only got into atari's a little while ago, unlike most of the
users on here who have seem to have used them for years. in fact, i didnt
even know how to USE a computer 4 years ago. Then my dad brought home an
IBM XT, and my friend showed me a modem, and i was off. that skimpy xt
has been upgraded so many times that its now a 486 with multimedia
goodies. :)

Then i started getting into 8bits. i started out with a
commodore. and went through several lines <includeing the ST..yeah, i
know its a 16 bit, but anyways> until i finally decided the one i liked
best was the atari. dont ask me why, i just think its a neat little machine.

I thought it was cool, here it is, a little computer, and i could
pick it up at a thirft store for 10 bucks! since then my GS has been
growing, and i was REALLY lucky to find an sx212 modem. My system at the
moment is just an XEGS, 2 1050's, sx212, and a keen little 9 inch screen
monitor that sits on my xegs all happy-like. oh, also an okidata printer.

i think i paid $30 total for the entire system. picking up bits
and pieces here and there. <includeing the small library of books i have
for the atari> why? because this little computer is a HOBBY computer. if
i have to do some serious stuff, naturally im going to lean on my IBM.
But i take amusement in seeing just how FAR i can make this little
computer system go.

My only source of software is from the internet. we had *1* xe
bbs in the orlando area, and it shut down a few months ago for lack of
support. Also, we have *1* atari dealership in orlando. I went out there
to visit once, < it was in the somewhat seedy part of town> and the
rat-faced guy who was running the place was pearched behind a FALCON
wired to the biggest mammoth of a keyboard id have ever seen. When i
inquired about 8 bit hardware/software i basically got laughed out of the
store. <you want WHAT?? HAW HAW HAW!>

so so much for that.

Anyways, would i fork out 20-30-40 dollars for atari XE software?
no. if i saw some really nice share ware i might send the guy a few bucks for his effort, but thats about it. I dont want to sound like a jerk here, but i also am a student. my fuinds are vasty limited <were talking generic cigs and getting excited about dollar draft here, guys>

Also, in my observations, commodore has a bigger audience for their machines. naturally i think its for its bigger software selection. Free, that is. Larger then the atari archives ive seen, at anyrate.

I guess my point is for software authors for the atari, yes, write some good stuff. And if you have any old stuff lyeing about, let it out for everyone to get. Not everyone has seen it, and its rather hard for them to get. if its all about just makeing a profit..well..i dunno..

<shrug> like i said, i dont want to be branded a dick, but i dont see the point in holding software back to the point where its going to be forgoten in the past. let everyone have a chance to see it without trying to make a buck.

>human players (to distinguish them, for one).

They remade Mario Bros. for the XE line on cartridge? Is it good? I wasn't _really_ impressed with the first version, but I enjoy the game, and I wouldn't mind getting another cartridge game to play. :-) Anybody selling theirs?

>--
>Russ Gilbert, user of the UniBoard System @ wariat.org
>E-Mail: Russ.Gilbert@apk.wariat.org

By the way, in UMICH's cislib_b 8-bit directory there is a file
"STRIP3.XMO" which claims to be able to strip the XMODEM extender bytes
from a binary file. Don't despair, this file is an ATARI Basic file
which can be loaded and run with the BASIC command:
RUN "D1:STRIP3.XMO"
I don't know how well it works, since I haven't really had a chance to
play with it. I tried it on HULK.XMO but was unable to load the file
after it was processed (maybe HULK is a DCM???).
Give it a try and good luck.

OK, I had to put my $.02 in. Whenever you do a directory, after all
the files have been listed the last line is ALWAYS something like:
<space><space><space>xxx FREE SECTORS
Where xxx is the number of sectors. Unless you want a built in delay
DON'T use the get byte routines. They're slow & then you have to parse
the files yourself. Just use something like INPUT #3,A$ 'cause it's
quicker & you'll have all the file names in a nice package. After
each iteration, just compare A$(1,3) to " " or A$(8,11) to "FREE"
& you won't need any traps/errors. You know your done before EOF.

HIYA ! I am the guy who started it. Artem Koutchine i am.
So, finely there is one smart, rational, nice, cool, blah blah blah
who thinks what i think and shares my opinion. Now i want to make some
comments.

: Hmm..thought i would just add my thoughts to this thread...

I would be great if everyone addes his thoughst.

: I only got into atari's a little while ago, unlike most of the
.....
: has been upgraded so many times that its now a 486 with multimedia
: goodies. :)

Hmmm. My first one was Russian computer called BK (means something like
home computer). Then a bunch of different 8bit stuff (ZX Spectrum,
AMSTRAD, ATARI, ROBOTRON) and 6 years ago 386SX16 with EGA. Then
a buch of upgrades and here it is : 486dx2 66 MULTIMEDIA RAM:8 HDD:412 !!!

: i think i paid $30 total for the entire system. picking up bits
: and pieces here and there. <includeing the small library of books i have
: for the atari> why? because this little computer is a HOBBY computer. if
: i have to do some serious stuff, naturally im going to lean on my IBM.
: But i take amusement in seeing just how FAR i can make this little
: computer system go.

You're lucky. In philly you gonna pay about 200$ for such a package.

: store. <you want WHAT?? HAW HAW HAW!>
fuck'em

: Anyways, would i fork out 20-30-40 dollars for atari XE software?
: no. if i saw some really nice share ware i might send the guy a few bucks

me neither. It just does not worth it.

: for his effort, but thats about it. I dont want to sound like a jerk

you don't

: here, but i also am a student. my fuinds are vasty limited <were talking
: generic cigs and getting excited about dollar draft here, guys>

OH YEH ! I understand you.

: I guess my point is for software authors for the atari, yes,
: write some good stuff. And if you have any old stuff lyeing about, let it
: out for everyone to get. Not everyone has seen it, and its rather hard
: for them to get. if its all about just makeing a profit..well..i dunno..

THAT IS WHAT I AM TALKING ABOUT !!!!!!!

: <shrug> like i said, i dont want to be branded a dick, but i dont
: see the point in holding software back to the point where its going to be
: forgoten in the past. let everyone have a chance to see it without trying
: to make a buck.

OH buddy. Most of people in here just not smart enough to understand it.

935. Atari 8-bit Newbie, Emulator Help FAQ to be WWW-ized!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-02 04:05:20 UTC
From: kendrick@zippy.sonoma.EDU
Message-ID: <9502020406.AA19774@zippy.sonoma.EDU>
Source record: 94873
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

I, (Bill Kendrick / New Breed Software) am setting up a Home Page on the World Wide Web.

In it will be the typical things; egotistical pages all about myself and my friends, but also a New Breed Software section (which include info. on my software for Atari 8-bits and IBM PCs, as well as most of the software itself) and an Atari 8-bit section (with links to other Atari 8-bit "Home" pages throughout the world (Wide Web)).

Why do you care? Well, if you have access to

Mosaic
Netscape
MacWeb
Lynx

or other World Wide Web browsers, you might like to check out a new Hyper-Text version of my FAQ (and I'll try to Hyper-Text-ize some of the newer FAQ's as well (there's now an Atari 8-bit Hardware Modification FAQ) and have links to already HT-ized FAQs on the other Atari 8-bit pages)).

I'm not going to put out my WWW address yet, but you can of course still contact me via e-mail at the addresses below.

I hope to make a rather intuitive and entertaining WWW page (and, unlike many pages I've seen, I'll NOTE, rather LARGELY when a link is going to be to some site other than mine).

How can you access the WWW and what is it?

The software listed above is for:

Mosaic: Mac, Windows, X-Windows
Netscape: Mac, Windows, X-Windows (I think)
MacWeb: Mac
Lynx: Unix, VAX (probably others; it's text-based)

The WWW is similar to Gopher; a hierarchical set up of information. Gopher'ing is much like going around on a BBS which is full of directories within directories in the file system (and everything has a nice description :)).

Using WWW (with the non-text-only-based software) is more like using HyperCard or MacroMind Director or Help in Windows. Some bits of text have "links" in them. When you select them, a new page appears (usually), or

a sound, graphic, text or animation is loaded and (dis)played.

The coolest thing about it is how much it's like HyperCard and "Director" versus Windows' Help. You get to include graphics within the documents; these can also have "links" in them (as if they were "buttons").

I could go on in more detail, but hopefully that gives you and idea of what it'd be like to "surf" the World Wide Web. For information on setting up your own WWW page and/or the HTML (Hyper-Text Markup Language) format, or just on WWW itself, well.. there's ways to do it. I can't recall where to FTP/Gopher/WWW to. I'm sure someone else will mention, and if not.. just find a way to use the WWW (try "lynx" on your shell account to see if you have a copy of it available to you) and I'll have some links to the information within my own page.

I've been cleaning out the closets again, and I would like to clear out the
following items ASAP:

FOR SALE - ATARI/COMMODORE ACCESSORIES/BOOKS

Book of Atari Software (400/800/2600/5200) 1983 (USED) $1.75
Atari/Commodore computer to monitor 4 cable connector (USED) $3.50
Wico Command Control joystick (USED) $4.00
Atari 2600 joystick w/stand (USED) $4.00
Commodore VIC-1541 Disk Drive (USED) $25.00
Game Mate II wireless joystick set for Atari 2600 w/power supply $6.00
Atari 2600 power supply $3.00
Set of 2 Power Stick mini joysticks for Atari $4.00
3 Atari 1020 printers w/o power supplies $10.00
Atari CO17945 9v AC power supplies (NEW) $7.50 ea. (1010/1020/1050,etc.) (3)
Computer to TV switch boxes for Atari game and computer systems $1.50 ea. (2)
Atari Basic cartridge CXL4002 (USED) $2.00
4 I/O cables for Atari computers $3.00 ea.
Computer to switch box cable for Atari systems $1.00
Joystick extension cable for Atari systems $1.50
Atari CO61982 XE/XL Power supply (NEW) $15.00

FOR SALE - NINTENDO ACCESSORIES

Nintendo Zapper light gun (NEW) $10.00

FOR SALE - ATARI 8-BIT SOFTWARE

Get Rich! Insurance Planning (Arrays Software), Megafont II/II+/Font Simulator
Package (XLent Software), Winter Challenge, Indus DOS XL Master Disk/GT Estate
Word Processor Package $4 each or all 4 for $12.50

F-15 Strike Eagle (Microprose) $5.00

USED: Math Encounter (cartridge), Spy Strikes Back & Spy's Demise (Penguin)
$3.00 each
Bruce Lee (Datasoft) $2.50, Pooyan (cassette-Datasoft) $1.00

Pensate (Penguin) $4.00
Computer Baseball (SSI) $4.00
Encounter at Questar IV (Artworx) $3.00

FOR SALE - ATARI 2600 CARTS

Realsports Football (2 available) $2 each

FOR SALE - ATARI 7800 CARTS

Ballblazer (2 available), Pole Position II
$2.75 each

FOR SALE - COMMODORE 64/128 SOFTWARE

Magic Johnson MVP (Virgin Mastertronic) $7.50
Dave Winfield's Batter Up! (Avant-Garde) $5.00
F-15 Strike Eagle (Microprose) $5.00
Candy Land (Gametek), Firehouse Rescue, Little People Bowling Alley, My Grand Piano, School Bus Driver (Fisher Price) $5 each or all 5 for $20.00
The Filer (Spinnaker) $3.00
Bop 'N Rumble (Mindscape) $5.00
Pensate (Penguin), Computer Baseball (SSI) $4.00 each

USED: Professional Gambler (Load & Go) $2.00
USED: Spy Strikes Back (Penguin), Spy's Demise (Penguin) $3.00 each
USED: Bruce Lee (Datasoft) $2.50

SPECIAL OFFER: All Commodore software except 4 children's titles above for $35 including shipping!!!

All items are brand new in original boxes unless noted.

Shipping charges based on size of order.
If interested, please contact Lawrence Estep at 71450,1050 on CompuServe or 71450.1050@COMPUSERVE.COM on Internet.

>Atari talks to the XEP over the joystick port, or is it something
>inherent in the XEP board, or the Atari?

I think, that _nobody_ can (and nobody _want_ to) modify the XEP 80,
due to a lot of Atari's cumstom chips inside. I am persuaded, that it will be
much easier and much cheaper, if anybody try to connect a VGA-style graphic
card to XL/XE. It were nice, weren't? I have thought about something like
it, but, unfortunately, I am not an electronic, then I cannot build a proper
interface. Nevertheless software does not look very difficult to develop...
(last, but not least: VGA-card looks to be much better, than XEP, doesn't it?)

Konrad M.Kokoszkiewicz
conradus@plearn.bitnet

PS. I wrote "XL/XE", but I have thought "8-bit-Atari". In Poland both
expressions are synonyms. Sorry to 400/800'er for this mistake.

>Note that none of this applies to Sparta; I don't know how a Sparta disk
>is organized. Actually, if anyone has any info, it should probably go to
>the archive.

Here's what I know about the Sparta Format :
First there are always the 3, $80 bytes long bootsectors. In the first of them there's written in the Total ,number of sectors, the number of free sector's, the label of the disk, the density, the first VTOC sector, the first sector of the main directory ...
These will need $30 bytes (if I'm right), followed up with a message printing program "NO DOS" - when no bootable programm is on the disk.
The second and the third sector will contain the real boot program.
At the fourth sector the VTOC will begin, each sector will have one bit and is free if the bit is set. The length of the VTOC depends on the sector size and the numbers of total sectors. After this the main directory follows.
First there is a sector (as for files too) containing all the sectors belonging to this directory (file) and if one sector is not enough there's a pointer to the next. And after this table the real directory (file) follows. Take the "DiskRx" program and have a closer look to disk in different format's. DiskRx will also work with Harddisks !!!

Matt

> The solution would have to be to add a second PIA. I have a file
> describing that on an Atari disk somewhere.

The setup I've put on my machine seems to work OK, it has an additional
PIA, and a little bit of logic so that either the original PORTB (sticks
3 + 4) or the memory mapping port appears at $D301. This is controlled
off the ROM select switch (so, when you are in 800 OS mode, you get
four joy ports, and when you are in XL/XE OS mode you get the memory
mapping register).

In the 800 mode, the mapping also works of a port at $CFFF, so it will run
software that's expecting the Axlon mem expansion.

This seems to work fine, since any program that wants to use more than
two sticks tends to assume that it's running on an 400/800.

The other half of the extra PIA comes in handy, since you can use it as a
printer port.

FYI, all the logic (320K ram control, 8 bit refresh generation, PIA switching
and ROM selection) will fit into a single Altera EP9000 - I love PLDs!

Pete

P.S. Does anybody know of a program that actually uses page switching for
ANTIC? I think this mod handles it correctly, but don't have any software
that actually uses this facility.

OK, so the subject line is odd, but anyway: I visited a friend during the Christmas holiday, and noticed that he has a nice mirror on the wall. On the mirror there's a picture of James Dean, and also a text saying 'This reminds me of the good old days'.

I would love to have a similar thing, not necessarily a mirror, maybe a poster, with an Atari 800 on it, or screenshots from some classic Atari games. Is there a place where I can find gif/jpg picture files with reasonable quality? It would be so cool with a tastefully composed poster in that style. The same text could be used, think of it: 'This reminds me of the good old days.' Also, Atari did have colourful and interesting pictures on the covers of their game packages, didn't they? Maybe the artwork used there would look good on posters too.

The 80 column Omniview & all software 3-4 bit wide term programs are marginal at best. They work, but there is no way humanly possible to make things like [$, #, %, *, &] look like anything but a scrunched up representation of themselves. There's also problems with horsepower, tossing around a bit mapped screen like most of them do requires too much for anything over the 1200-2400 baud range. I've never used it, but I'd guess Flicker Term fickers as advertised.

I've seen most of the boards you mentioned, & from what I've seen, they should be able to toss around 2k characters <~16k baud> to the screen so they would work if modified for anything but an 800. Bob Wooley also did a 6545 hack into his 1200xl but last time I talked with him, the person who had offered to write the software handler for it <circa '88-'89> didn't ever get it completed. It's academic for now since about 1/2 the users in the 8 bit market place wouldn't want to put the birds nest of wires in their computers & the PBI seems to be grabbed by mio's & black black boxes. IMO: To be viable, you'd have to get something that works with [mio, black box, all 8-bit computers]. The only thing left is an internal daughter board, which BTW I've been asked not to do, & the cartridge port. The cartridge port presents it's own problems since you have to add a phase locked loop to generate the dot clock, a 40 pin 6545, a character rom, at least 2k of ram, 2k of character rom. Just ain't that much room in there.

My info on having a board made is minimum order of $150 for the first two boards, with the cost per board for production TBD. Plastic for a case? Last I've heard you have to pay at least $600 to have an injection mold made & I'd bet it'd have to be done just to fit all the parts.

Off the wall, but I'd like to make it clear that it's really not development of the circuit that cost time/money. Heck Wooley seems to come up with a design a month, it everything that happens after words if you want to market it. Anyway, that's why you will probably never see a non-bundled product, like HD interface/printer port/serial port. The cost difference for deleting any item is only about a $10 saving & if you deleted everything a vendor would still have to sell the empty box & circuit board for $100 to stay in business.

James; I don't see your problem. *EVERY* newsgroup I've been in is less
responsive then this one. The FAQ has all the info you could possibly
need & there is a list of vendors. You seem to be complete ignorant
of "Netiquette" <Whoop! completely above>. NEVER go into a newsgroup
cold turkey & just start posting these types of questions. Not just
here, but anywhere on the net unless you want to risk being flamed.
The proper way to do this is to scan all the existing messages for the
FAQ, if it's not there, then just post a one line message asking where
it could be found or could the person who maintains it send me a copy.
You know the real reason why I don't respond to you? Because your questions
are usually followed by Michael Current posting the FAQ. I think everyone
here probably assumed you were smart enough to read the FAQ so they didn't
bother to reply since it would be redundant. There's no rules to speak
of on the net, but this is the way things work. There may not be any
such thing as stupid question, but asking these types of qestions that
we've all seen for years & are answered elsewhere are anoying.
Sincerely
Rick

: characters. Any suggestions?

On the PC, 0-8 and 14-30 are characters.
9 - tab
10 - "paragraph" (eol)
11 - newline
12 - new page (clear screen?)
13 - reserved

31 - reserved

I think you can add a toggle option to ignore all control chars except
the above (crippled terminal), and implement the extra characters. Don't
know if it's worth it though.

Myself, I am adding 130XE capability to Ice-T, since 48K just ain't enough.
A new addition is full 8-bit capability, meaning that the entire IBM
character set is there, above 128... Which is great (for now only for ME),
since I use PC-based BBSs with Hebrew (which begins at 128) and graphics
characters and the like.

Source record: 94898

>... If you just want something simple you
>can use with the xl's built in basic, can just use 7 data bits & one bit to
>strobe the printer, I can do it in two chips.

I did a printer interface once, by using the joystick ports. Basically all you need to do is use 7data lines and the 8th as the strobe - like Rick said above. But, you don't need any chips to do it.

I just altered my printer on the font panel to be only 7bit, instead of 8 (you get all ASCII, but not the extra graphics stuff). Oh, actually, if you have a 400 or 800 with 4 ports, then you could just use another joystick port, and have all 8 pins...

I only ever used it a couple of times, so I didn't hook up the busy line (well I was calling it from Basic, and didn't figure there'd be a problem). But, if you want to use the BUSY line, you should be able to just connect it up to one of the fire button pins.

A handler should be really easy to do for it - or if you just want to print something from a program, then just do it from Basic or Assembler without implementing a handler.

In pseudo-basic, the code should be something like:

To set up the port for output:
```
old=peek(54018)
poke 54018,old AND 251 ;This will set joystick ports 1&2 to output
```

To output a character:
```
a=asc(char) AND 127 ;The 127 is just for safety - masks off the m.s bit
poke 54016,255-(a OR 128) ;subtracts from 255, as the joystick output appears
to be active low - i.e. a Logic 1=0 Volts
poke 54016,255-a
```

The first poke to 54016, outputs the data and the stobe, the second clears the strobe line. I can't remember too well, but if that doesn't work, then swap the 2 lines, or change the first line to:

```
poke 54016,(255-a) OR 128
```

And again if that doesn't work, then swap the lines - one of these combinations should work - I have done this on my printer several years ago.

Then to reset the port to input when finished:
```
poke 54018,old
```

That's all! Oh btw - Atari Basic doesn't have logic AND, OR unfortunately. There are ways to get around this (I use a small machine code routine in a

string) though. You could use IFs or something - and you don't really need
to store the original value of 54018 - it's just a habit I have got into
from programming on my ST. The main thing is to clear the 2nd bit (starting
from 0, not 1) when you send data out, and set it to put things back to normal
(i.e. input).

Well that's a cheap way of doing it anyway.

His question was about submitting stuff to the archive, not getting
it. Last I checked gopher was a one-way interface, except for
entering search requests.

Besides, I just tried gophering there, and it wouldn't let me into the
atari archive. (I've done it successfully before though.) So it's
not ALWAYS "no problem".

Back to the original topic: I did email the pbi1200.txt file to
lenn@archive.umich.edu. I don't know if it's up yet. If not, it's
still available via the web:

Yep. But unless you boot from an ED disk in that drive, you have to
switch the drives density manually. It's been a while since I had an
Indus, but I remember that you hold one of the buttons while pressing
another one. (Sorry I can't remember which buttons.)

If this question isn't in the FAQ I think it should be.

963. CC65

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 00:58:00 UTC
From: per.erik.peterson@asb2.ct.se
Message-ID: <ftn_2.203.221.10$fidonet.org_2f318249_Per.Erik.Peterson@asb2.ct.se>
Source record: 94901

I can inform evryone that I have solved my problem whith Floats in CC65.
It tooked me 2 weeks to understand that the example in the FP65-manual was
corrupt. The example looks like this...

```
#include "stdio.h"
#include "math.h"

main (argc, argv)
int argc;
char *argv[];
{
char buf[20];
char f1[6], f2[6];

atof(f1, argv[1]);
atof(f2, argv[2]);

fadd(f1, f1, f2);

printf("%s + %s = ", argv[1], argv[2]);
fputs(ftoa(buf, f1), stdout);
fputc('\n', stdout);
}
```

And the second last Line is the one who have gived me this 2 weeks of trouble.

The correct line is...

```
fputs(ftoa(f1, buf), stdout);
```

Can someone open the FP65 package and edit this manual. I cannot as I take This
Newsgroup throw Fiodonet. I sugest ex Michael Current to do this so not evryone
goes ion this doc and makes changes. CB-)
Can you confirm this suggestion Mike.?? (Y/n)

I dont want enyone else to get the same problem I had as it unnescisary.
But I have learned a lot of it I can tell you all as I have tried many
combinations here to make an own simpler program who I wanted to print out 1.0
to the screen as String to float back to string again. The XE only wanted to
print 1.0 as 0.100043E-<6 and I understand that if this program wanted to put
the buf into the float instead of put the float into the buf.

I was very happy 5 am this morning when I notised this error in the only list
example there is for CC65 at all. One list, one error.
(I have also baught Prospero C and Lattice C in second hand for my ST and
Prospero is GREAT. I havent looked at Lattice yet as I picked it up today. But
I will program my dear 130XE in first place.)

I figured someone would point this out to him. :)

I use FT80 and find that it does a fine job.

Has anyone suggested that the author of that program make the
portion of the program that produces the display into a driver loadable
at startup, and useable with BASIC, etc. (programs that use the E:
device)? It should be possible...perhaps even rather simple.

Call BEST Electronics and/or B&C Computervisions. Their
phone numbers/addresses are listed in the FAQ.
Strange tht you can't find DD 5.25" disks in your area. Here
in the Chicago area, the office supply "warehouses" (ie, Office Max,
Office Depot) stock DD disks in at least three brands, plus a generic
"brand".

967. Re: Where to get 8-bit upgrades/labor????

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 01:29:18 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <pSwarOG.ransom22@delphi.com>
Source record: 94755

James Wood <jamesw@CSOS.ORST.EDU> writes:

>1) All of my 8-bit floppy drives are old, but seem to work well. I've
>had some problems losing data, however. I run old Sparta 3.2d. (Yes, I
>need to upgrade...I just don't have my 8-bit with me at the moment).
>I figured perhaps the belts are just old....Hell, I don't know. I'd like
>to have someone check 'em out, and maybe clean, align, and replace the belts.

Depends on the drive you have. If it is an Atari 1050, you can
get a new mech (which will fix all problems not related to the PC board)
for $17.50, or two for $29.95 from American Technavisions. This is
less than you would pay to have a technician look at your drive.
Info on American Technavisions is in the FAQ.

>2) My only memory-modified machine died; probably a bad ROM. Need it fixed.

In this case as in all others, depends on how "electronically
inclined" you are. Some prefer to swap chips out in hopes of finding
the problem, others have other techniques. I, being of the type that has
extreme difficulty desoldering, typically will just buy a whole new
board at BEST Electronics when something dies. It ain't cheap, but the
few times I tried to repair things myself, I just made the situation
worse and had to buy new anyway. :)

>3) My 130XE cart. slot doesn't work - like to have it fixed, and perhaps
>the memory upgraded.

For th cart slot, if the fixes listed in previous messages didn't
work, see my response above. :) As to the memory upgrade, you might
try the vendors in the Faq to see if anyone offers plug-in or easily-
performed memory uprades for 130XE's.

>4) I'd like memory upgrades on some of my other machines.

See above.

>5) I'd like **someone** to help me get a hard drive working....I don't
>know what I need to get one going on the BB, and I don't know what
>software/formatters I need to run, once I get the cables plugged in.

Well, lots of folks here say Bob Puff is a great man who will
help a customer or potential customer out. Give him a call (His #,
as all other Atari Vendors #'s are, is listed in the FAQ). Since you
are apparently a potential customer, I am sure he will be eager to
help (if the stories that appeared here recently are typical).

>6) I'd like to get those neat Video/Audio upgrades done, on at least ONE
>of the machines. Has anyone ever done the stero sound thing (Gumby?)

Can't help you here at ALL, but thought I'd respond to it
anyway so you don't feel as if I am ignoring you. :)

>Thanks in advance.
>
>James

you're welcome. Hope I was able to help. Again, I am no electronics
expert, so I just gave you what I would do if I were in your situation.

>PS- WHY DOESN'T ANYONE EVER REPLY TO MY POSTS? HAS MY DEODERANT
> FAILED ME???? :)

This is pure guesswork on my part, but perhaps folks get tired
of responding to some of the more Frequently Asked Questions. Another
theory I have is that everyone assumes that someone else will respond,
and thus no one actually does respond. :)

Happy 8-bitting.

[bunch of flamage deleted]

Hoo, boy. That's the way to get helpful responses, lemme tell
you!

I responded to your questions which I noticed had not been
responded to. That was before seeing this message, however, or I
would not have done so.
I did not note the date of your questioning message. However,
it just appeared at my site today. If you sent it several days ago,
then perhaps this is the reason no one had responded yet -- it
hadn't made it round the 'net yet.
Your acid-coated message really bugs me. I shouldn't let it,
I know.
Hell, I have personally answered many, many questions. I am
no expert, but I did give answers where I could (usually stuff about
where to find things, as I tend to collect 8-bit catalogs). Many
others on here also answer queries when they can.
By insulting the readers of CSA8, you have taken a step on the
road to being ignored by the group. That is exactly the opposite of
what you wanted, is it not?
Gadzooks, whining about not being given instantaneous, free
advice! Amazing.

I hope you regretted writing that message after you did so.
We've all done that sort of thing, I am sure. Please tone it down
a bit, have patience, and rejoin the group -- as you note, we are
a small bunch that needs to stick together. I welcome anyone who
shares my hobby to this group, and am glad to see new faces. So, please,
don't write off the group, and don't flame us because we haven't
answered your every wish as fast as you would like. We're all in this
together...let's not break it apart with such frivolous disputes.

Hmm, there's a protect button, track button, and drive button. I've looked
in the manual, but since it came out before DOS 2.5, it does not mention
enhanced density. Should the rear dip switches be set to single or double
density for this trick? Anyone?

Btw, one of you wouldn't happen to have an extra 1050 power supply that you
don't mind selling, would you? SShould say "9v AC 80va" on the bottom.

[lots of stuff deleted,mostly quoted ravings from a lunatic, not Glenn]

>I guess I better get my Kill File ready for this guy (and I suppose others
>will throw me in there too, so be it).

Geez,this is getting depressing. Not only is James Woods writing
us all off as a bunch of unhelpful/possibly ignorant people, you're
assuming the vast majority of users here hate you.
People may disagree with you, but I doubt that anyone hates
you or anyone else on here. People disagree with me all the time here
and on my BBS (as well a on my BBS network). That's part of the fun!
Part of the challenge of communication.
When people disagree with me intelligently (like the great posts
made in reply to my assertation that the Atari 8-bit is all the computer
anyone needs), it makes me think. I have to solidify my argument,
and strengthen my points. Sometimes it makes me realize I have a weak
argument, and I subsequently rethink i, poften changing my opinion.
I consider that fun!
It would be boring if everyone agreed with me. :)
Imagine each posting being quoted hundreds of times, all with the
addition of only "Yeah, you are so right"! :) Boooorrriiiinnnggg! :)
Each of us here contributes to the discussion, making this
newsgroup enjoyable to read...and enjoyable to participate in!
So, just because I (and others) disagree with some of the
points you make, don't take it personally. Your posts aren't
flames, so you are taken seriously.
You will be missed in your absence from the net.

As I recall, C/65 was actually a collection of macros; once your C program
was complete, you'd use MAC/65 to assemble the macros. It never really
caught on.

>
There is in fact a solution, that I personally use at 9600 baud. It's called
FlickerTerm, and it's available from the Umich archive. It uses a redefined
character set, and fine scrolls half a character width every VBI. By showing
two alternating displays (hence the "flicker" in the name) you get 80 columns.
There's bold and inverse as well, plus a really good VT100.

If you can't get files via FTP to your Atari, Email me and I'll sned out a
disk.

The black box plugs into the PBI on a 800xl or 600xl, or to the ECI on the 130xe. It provides a HD interface, optional printer buffer, parallel printer interface, and serial port which operates at up to 19200 baud. It is a product of Computer Software Services of Rochester, NY (address in the vendor/developers list, posted about the 15th of the month). Price is $199.99 plus shipping.

There's also The Floppy Board, an add-on for the BB, which permits you to add up to four standard floppy drives (360,720,1.2 or 1.44).

I've never owned either, but most people really like them.

I don't think it matters, but you might try it both ways.

>Btw, one of you wouldn't happen to have an extra 1050 power supply that you
>don't mind selling, would you? SShould say "9v AC 80va" on the bottom.

I don't, but it's the same supply that the 400/800/1200xl and most of
the other Atari peripherals used, so it shouldn't be too tough to find
one.

I don't see why HD wouldn't work -- the only macroscopic physical
difference is the missing hub ring, and the magnetic properties are
better than DD.

No! DON't compare the first three characters with " " or characters 8-11
with "FREE"!

This won't work with all DOSes (namely, MyDOS; I think Atari DOS puts the
free sector count right at the beginning of the "FREE SECTORS" line as
well..)

I check the first character for a number, since MyDOS and AtariDOS, and
if I remember, SpartaDOS (NO FLAMES, FOLKS! It's been a while since I've
booted up Sparta! :)) all place the free sectors value at the BEGINNING
of the line.

If not, I guess just make it check in a number of ways... but all of MY
code is just:
IF A$(1,1)>="0" AND A$(1,1)<="9" THEN ...

Anyway...

later!

James! Again, check out the following two new programs:

FlickerTerm80
Ice-T

FT80 is by Clay Halliwell (of ColorViewSquash fame) and Itay Chamiel (of.. umm.. Ice-T and The Wall fame (well, I dunno how many people know about The Wall, actually :))).

Anyway, FT80 uses a design which I actually came up with (but so did Clay himself) which uses two Graphics 0 screens which are flipped between (hence the "Flicker"). They have 3-bit fonts, and yeah, so does all other 80 column on the Atari (without hardware) but the advantage here is the scrolling is incredibly fast. Rather than scrolling 8K of data, and plotting text (placeing 8 bytes and doing OR's and AND's and stuff with the bits) you just scroll 2K of data and to write text, you just place one byte!

Ice-T uses a typical Graphics 8 bitmapped screen, like most other software, BUT the advantage Itay's added is again, faster scrolling. Rather than scrolling 8K, he just redraws the display list so it LOOKs like the data has been moved; he only needs to clear 320 bytes (1 line; the new bottom line) rather than scrolling about 8K and THEN clearing the 320 bytes.

Both programs support 9600 bps and above. They have their own specialities; I think Ice-T is the only one with file transfer so far, and it's just X-modem (download only I think, too?).

THey also both support VT emulation. Ice-T has and advantage because he'll be able to support more than 128 characters if he wants to, since it's bitmapped. FlickerTerm though gets to use 4-bit wide characters (versus 3-bit wide). Clay found that the flickering causes pixels which are directly adjacent to each other but within different character cells across the screen (thus, in different frames of the flickering) to look like there's a very thin blank line between them, so he used that to his advantage and was able to get a very nice looking, and very unique, 4-bit font.

Of course, Ice-T's font is very good to, for a 3-bit font.. I dunno where Itay got it or how he thought it up, but it looks very good compared to a lot of other 80 column screens I've seen.

Anyway.. I believe a review of both might be in one of the upcoming _Current_Notes_ or something.. talk to Rick Reaser (don't have his e-mail address handy) or ask on c.s.a.8 for details.

Good luck!

989. PX XFORMER to DOS Utility

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 08:34:00 UTC
From: MIS0160@MVS.UDEL.EDU
Message-ID: <19950203083409MIS0160@MVS.UDEL.EDU>
Source record: 94787

Is there a utility that will take a file on an Atari virtual disk
used by PX XFORMER and create a DOS file?--kinda the opposite of the
XFORMER's ability to import a DOS file as a 1-file virtual disk.

Roger Cole INTERNET:Roger.Cole@MVS.UDEL.EDU

990. SOFTWARE AT ARCHIVE

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 08:58:24 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3gsr7g$q7d@usenet.INS.CWRU.Edu>
Source record: 94780

I have uploaded several programs to the archive over the past
couple months: BURGER.ARC a burger time clone game,
KASM, KLINK assembler and linker. AMAC and RA65 compatable.
KEDIT151 an Action type text editor. Newest version fixes bugs
in earlier versions. DISKFORM a program that can send and
recieve disk and diskimages to a PC with a terminal program
capable of standard XMODEM (not CRC) transfers.

If anyone has tried any of these or had any problems let me know.

Send comments/problems to
cp576@cleveland.freenet.edu

991. Vladimir Elberg the Intel advocate

RESEARH.

I ASKED PEOPLE IN OTHER NEWSGROUPS, CHATS, REAL LIFE WHAT THEY THINK
ABOUT WHAT IS GOING HERE.

NOBODY CALLED IT SMART MOVE
MOST OF'EM SAID THAT YOU ARE PEOPLE REALLY LIKE TO WAIST YOUR MONEY
SOME PEOPLE SAID THAT YOU ARE PEOPLE UNFUCKABLE RICH !!! :-) (i hope so)

Think about, these are not my opinions, these are opinions of
other people, tons of people.

993. Re: Joining of comp.sys.atari.8bit and the Atari Pro! Network?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 11:34:08 UTC
From: James King <jeking7@delphi.com>
Message-ID: <5y3YbyI.jeking7@delphi.com>
Source record: 94783

James Wood <jamesw@CSOS.ORST.EDU> writes:

>In some messages there, I saw references to the possible incorporation of
>the comp.sys.atari.8bit as a networked message base over the Atari net.

What you saw was MY effort to interconnect comp-sys-atari-8bit and the
Atari Pro! network. Unfortunately, those non-internet types on the
Pro! network complained so much about the internet messages, that I'm
bagging the idea!

Cross-posted to: rec.games.video.classic,rec.games.video.marketplace,alt.atari.2600vcs,comp.sys.atari.8bit

```
// European Atari stuff Auction - Update 3 February 1995 //

E-mail bids to zeist@serc.nl. I will inform you when someone has done a
higher bid on your item. Go on! Make me an offer! The 'by' section states the
first name of the current highest bidder (in my previous auction I stated the
first part of the e-mail name, this makes it easier for me).

Remember: I pay postage and packing; your bid is all you have to pay.

I will post this auction update once a week (on friday) to r.g.v.marketplace,
r.g.v.classic, alt.atari.2600vcs and c.s.atari.8bit. Auction ends friday
17th (Feb).

All games (and the console) are PAL versions, new in shrink-wrap. E-mail me
if you want to receive updates via e-mail, or if you have a question on an
item. I have descriptions ready to send.

##### 2600 carts (min $10):

I've never actually got around to writing it up, although I do still have
all the notes. I'll try and sort out all the info, and post it.

Are you just interested in the PIA switching or the whole thing?

Pete

NOT clear screen. On a printer it ejects the current page, but on a
terminal it usually prints as either "^L" or a little female symbol
(with the IBM character set).

1002. Re: Need 1050 ED disk VTOC info!

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-03 19:27:17 UTC
From: richczeta@aol.com
Message-ID: <3gu02l$kpg@newsbf02.news.aol.com>
Source record: 94793

The Hardware Manual states that the DOS 2.X VTOC's bitmap extends from byte 10 to 99. 90*8 = 720 bits. So where's the bitmap for a 1050 ED disk's extra sectors? Using the rest of sector 360's bytes, only 944 bits/sectors can be accounted for. (Dos 2.5 may or may not use the rest of sector 360 for the bitmap, I don't know.)

Another sector must hold the rest of the bipmap. So, where is it? I know it's there. A DOS 2.5 ED disk has 1023 usable sectors. 12 are used by DOS, leaving 1011 free for files. VTOC = 1, File directory = 8, Boot sector = 1, and I assume the last sector is unused like a SS 720 sector disk. That's 11 sectors. One more is used, which I assume to be the extra VTOC sector. But which sector is it? Matthias Belitz says $400. Is this correct?

I have owned Indus GT drives for years, and I never had a
problem. They always functioned exactly like a 1050. With DOS 2.5, I'd
just choose "Format disk" and it would automatically format in the
"enhanced" format. Of course, "Format Single" would generate a
single-density disk.

Is your drive refusing to format?

That may be your opinion, and I am new to the net, but my limited
experience on other groups has proven otherwise. On other newsgroups, I've
received numerous replies from intelligent posters; on any newsgroup, I
reply if I know the answer. Perhaps your luck in other newsgroups has
been different.

> need & there is a list of vendors. You seem to be complete ignorant

Yes, I am new to the net. Am I "ignorant?" I'd prefer to choose
the word "uninformed." NEVER go into a newsgroup and post questions?
What the F___ is the group for? As for flaming me....go ahead...I'll reply.

A list of vendors? Is there a price list? Are prices always the
same between vendors? Are prices always the same ANYWHERE over time?

> The proper way to do this is to scan all the existing messages for the
> FAQ, if it's not there, then just post a one line message asking where
> it could be found or could the person who maintains it send me a copy.

That is true. However, in my opinion, a simple question that can be
answered in one or two lines by someone who may have had recent
experience in relation to the question, would take up appx. the same time
and bandwidth, and obviously faster. I'm sure the FAQ is informative,
however. I'll have a look.

> You know the real reason why I don't respond to you? Because your questions
> are usually followed by Michael Current posting the FAQ.

I highly doubt there is any correlation between my posting of a question,
and the posting of the FAQ. Would you be so kind as to provide me with a
correlation coefficient?

^^^^^ ^^^^^^^

PARDON ME, BUCKO! The questions I asked were simple. I was not asking anyone to write a book to answer my questions. If you want to question my intelligence based on this matter, you'd better be prepared to go face-to-face.

The things you have said lead me to believe that you are VERY egocentric; it is relatively easy for any moron to masquerade behind a keyboard, purporting to be a genious. In one small paragraph, you have 1) questioned my intelligence, 2) told me "the way things work," 3) spoken for everybody, and 4) been annoyed at questions about ATARI 8-BITS in the ATARI FORUM.

I do not know what your calling in life is, but this is a hobby for me, albeit one I am serious about. Let me offer you a nickel's worth of free advice, Mr. Cortese: DON'T YOU EVER attempt to assess someone else's intelligence because they are not as informed as you are in ONE particular area. I do not know you or your credentials, so the only factors I can accomodate into my assessment of your intelligence has been the flagrant arrogance throughout your message. For your sake, I sincerely hope that there is more to you than that. However, I won't go into the specifics of questioning your intelligence as you have done mine (you are freely permitted, of course, to speculate my opinion of your intelligence, however).

Also, I would advise you to drop the surly attitude (it's very unbecoming) , and perhaps seek counseling about that anal-retintiveness that causes you such anguish and irritation at the questions of a newbie.

MY FELLOW 8-BITTERS: I apologize for posting this reply publicly, but I felt it appropriate to manifest my reposte in an equivalent manner to its antecedent.

MR. CORTESE: Feel free to reply via E-mail, but I'd just as soon have you keep this garbage in E-mail and off the rest of the net. However, I'd just as soon NOT read your garbage at all.

Sincerely (very much so),

James

When you go into a newsgroup, first READ the posts to see what the
newsgroup is about and to see if your questions have been answered
recently already. READ the FAQ to see if your questions are common
ones that have readily available answers.

And remember that any newsgroup involves some give & take. We (yes, I
said WE) both ask and answer questions. It's a two-way street.

>> The proper way to do this is to scan all the existing messages for the

Maybe it takes you the same time, but it saves a lot of time for the
rest of us if you go to the FAQ first. That's what it's there for!

>> I think everyone
>> here probably assumed you were smart enough to read the FAQ so they didn't

The reason _I_ didn't reply is your put-down attitude from the
beginning. Why should we answer your questions when, in the same
post, you heap verbal abuse on us?

>The things you have said lead me to believe that you are VERY egocentric;
>it is relatively easy for any moron to masquerade behind a keyboard, purporting

1) I didn't see anything there questioning your intelligence. He was
saying we figured you could read the FAQ on your own.
2) "The way things work" in this case is simple netiquette. If you
are new to a group, read the FAQ before posting. Any newsgroup will
tell you that.
3) Well, he pretty much spoke for me. I wouldn't have been quite as
charitable, though.
4) ....annoyed at questions which are answered in the FAQ. Also
annoyed at your attitude.

>Also, I would advise you to drop the surly attitude (it's very
>unbecoming) , and perhaps seek counseling about that anal-retintiveness that
>causes you such anguish and irritation at the questions of a newbie.

You're the one with the surly attitude.

>MY FELLOW 8-BITTERS: I apologize for posting this reply publicly, but I
>felt it appropriate to manifest my reposte in an equivalent manner to its

No, ROb.. not always.. I'm used to ^L being clear screen on 99% of the
online "stuff" I've used.. At least under ASCII or ANSI..

(Also, the Think C standard "console" output (an 80x24xmonospaced-text window)
supports ^L for clearscreen.. for compatibility I guess?)

That was the small Our5oft demo. Yeah, that was pretty cool. It also fakes about 25 player/missiles in the same area of the screen (and then another 4 or 5 at the top for a swinging logo).

The thing is, rather than doing a WSYNC within the DLI code, they just timed it perfectly to mix Graphics 8, Graphics 9, and Graphics 15 all on the same line. As for the "25" player/missiles, it was 9 objects:

1 Large, blocky yellow ball
8 3-colored sprites

The trick is though, they only ever had 5 PMG's on one scan line at a time, just like is the technical restriction. The large blocky yellow ball was probably the 4 missiles turned into a 5th player, and the 3-colored sprites were really just two PMG's aligned, and then switched into the "3rd color" mode. Two of those make a total of 4 players + the 5th player.

Pretty neat trick though. If only more games used that.

There IS a demo which literally puts up 8 sprites on the scan line, and that I don't know how to do (except maybe an APAC/ColrView style frame-flip like I'm planning on doing for a coupla upcoming games (well, at least one)).

And finally, the "Sweet Illusions" demo has a VERY nice introduction part.. at the end they have the coders' faces slide up on the right side of the screen (in 80x192x16grey mode) and then on the left side, in Graphics 0 or Graphics 8 (320x192x2mono mode) a description of them fades in or is typed out or something.

That whole demo's pretty fun to watch. :)

From: kendrick@zippy.sonoma.edu
Message-ID: <3gufuj$5il@nic-nac.CSU.net>
Source record: 94802

There are two PC utilities which can (usually) extract files out of PC XFormer
and SIO2PC "ATR" files (I know of none which handle XFD's).

s2pc is one, and atarimg is another. They're both available at UMich
(atari.archive.umich.edu (FTP) or gopher.archive.umich.edu (gopher) or
mirror.archive.umich.edu (one of the Umich mirrors; note not all carry
the Atari 8bit directories).

One more note is that be sure you don't accidentally download one of the
many versions (why so many still!? delete the old ones already! :))
of SIO2PC, because many of the SIO2PC ZIPs have "s2pc" in the name.

s2pc might be in the Diskutils directory... I sometimes use s2pc, but
usually just run "FILE2PC" on my Atari when it's hooked up to my PC
via SIO2PC (or even easier (but much much slower) is to set up SIO2PC to
capture P:rinter calls into a PC file with no translation and then just
Copy files to the P:rinter on the Atari, but this is useless if you don't
have an Atari and SIO2PC setup).

Also, I cannot run Atarimg because it uses some graphics mode which my
MCGA-pack'in 4MHz IBM PS/2 #25 8086-based machine doesn't support.

Later!

> doing OR's and AND's and stuff with the bits) you just scroll 2K of
> data and to write text, you just place one byte!

Minor clarification... FlickerTerm doesn't physically move the
character data when scrolling-- it uses the same technique as Ice-T
(rewriting the display list). Early versions of Flick used manual
scrolling, but it lost characters on every line at only 4800 baud!
So I went to the display list technique (good thing too, as blinking
text adds another 2K of data!)

However, the P/MG underlay data IS physically scrolled. Recommended
for low-speed (<9600) or hardware flow-controlled connections only.

> Both programs support 9600 bps and above. They have their own
> specialities;

Non internet junkies might also like to know that Flick has (almost)
full ANSI/IBMASCII support. A heckuva lot better than ANSITERM.

James Wood (jamesw@CSOS.ORST.EDU) wrote:

: WHERE CAN I BUY ATARI 850 PRINTER AN MODEM CABLES? HOW MUCH?
: Anybody receiving on the other end?

I hear you loud and clear.

You can buy an Atari 850 interface and printer and modem cables from:

B&C Computervisions
1725 De La Cruz Blvd. #7
Santa Clara, CA 95050-3011

1-408-986-9960 Phone Hours T-FR 10am-6pm SAT 10am-5pm
FAX 408-986-9968

From their catalog:

ACA002 Atari 850 Interface (Reconditioned) $74.95
CAA002 850 to Printer-Parallel Cable $15.00
CAA003 850 to Modem $15.00

Hope this helps you.

Wow, that's steep.

I've got an extra 850 interface and parallel printer cable
(originally for Atari's 825 printer, I think- picked this up from a friend).
It worked before being put in storage. Includes power supply and
SIO cable, but no box or manual. If anyone could use this, I'll
send this stuff anywhere in the U.S. for $25.

Mark

1023. Re: Hang it up??? Atari8 really dead?

Source record: 94813

Rob, I know your heart is in the right place too, but I seriously question if this guy's for real. I think he's just baiting us & I'm not joking. Just as an example, his post about burned out OS ROM was posted on the 25th. Dave Patterson, much to his credit, made him the offer of free ROMS before I did. As a matter of fact, the post from Dave showed up at Portal before Mr Woods post. I responded with an offer of free ROMs the same day I saw the message on Portal & I believe it went out before he flamed us. I'm not sure about the exact time, but I think Joe Walsh got out his answer before the flame. Let's see, one post from Mr Wood asking for assistance for which he got two offers of free hardware & one message detailing solutions. I also checked & sure enough, there was a post for FAQ vendors in between his question & his flame.
BTW: I shouldn't keep a dictionary next to my computer, but ignorant is defined by Webster's as uninformed.
During this same time period, there was the post by Toad Computers. Don't you get a little suspicious yourself when somebody complains about lack of support for Atari 8 bit computers? I laughed out loud myself. Could anybody that owns one REALLY think there is support? Ha Ha HA! I'm really to the point where I'll publically offer to fix the thing for free just to see if this guy really owns one.
The guys complaints are so completely without merit that I think the only thing he should do is appologize to the sig as a whole or blow away. We have enough personality conflicts without somebody making up this kind of stuff. The slights he talks about are either a joke <most likely> or imagined. The guy is just completely out of line/off the wall. He even took it upon himself to warn someone he won't get any help in the sig. It just so happens I did get in touch with the guy who asked about the ibm<>atari transfer & I think the whole thing was resolved within his "URGENT" time period. I won't know for sure I helped, but at least the guy didn't flame the whole group. Nahhh, this guy sounds like a C64 user playing a joke.
Sincerely
Rick

Source record: 94815

In a message dated 1-30-95, Fredrik Lundholm said:

"Certainly, isn't the MSX computer clocked at 8 MHz?"

More like 4 Mhz for the standard CPU on MSX-1 computers. In fact, I think 3.58 Mhz was the exact speed. I have no idea of whether the "standard" speed was bumped up in the MSX2 and 2+ standards or not. There was also the Turbo-R, but that is really getting far out into MSX territory.

"Blow it out of the water! sure the 6809 has a lot of registers and complicated opcodes, but since there are so many, the processor require a lot of tics to decode and process the instructions."

Faster? Perhaps, perhaps not. Blow it out of the water? No way. Along with my two Atari 8-bits, I have a 6809-based CoCo 3 running at 1.89Mhz. All things considered, I would have to judge it to be every bit as fast as the 1.79Mhz 6502 in my A-8's. I believe interrupt latency on the 6809 is higher than with the 6502, making the 6502 a better choice (at the same speed) for such things as serial communications. However, the 6809 is definitely set up better for some things, such as multi-tasking (where its registers come into play). Also, if the way it handles the 32K size screen modes available on the CoCo 3 is any indication, it apparently handles byte moves faster than an equivalent speed 6502.

Actually, comparing the 6502 to the 6809 is encouraging sibling rivalry, as both have the same "parent"...the 6800.

Both also have more advanced brethren. The 6502 has not only the 65C02, but also the 65C816. The 6809 has the Hitachi 6309, which was supposedly only a CMOS varient, but some folks discovered some time ago that Hitachi built in their own, faster, more capable "native" mode, which is now exploited by at least two OS-9 system software patch kits for the CoCo 3.

1026. Re: PC-Filesystem - does anybody has coded it yet

Newsgroup: comp.sys.atari.8bit

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <R014LKT.lmcclure@delphi.com>
Source record: 94816

In a message dated 1-30-95, Glenn Saunders said:

"The true PC filesystem may require too much memory overhead
to be viable on an 8-bit CPU."

Virtually all of the PC filesystem setup dates back to at least DOS 2.11. As I recall, many PC's were still only 128K at the time, with 512K being considered "large". Take a look back at the old 2.11 code for the system files, and even add in COMMAND.COM for that version, and as I recall, you'll still fit within 64K with room to spare. Considering that is in less-efficient 8088 code, a 6502 version should be about the same size as MyDOS or SpartaDOS 3.2.

"There is also the issue of copyright. I don't know how
Atari's ST got away with its MS-DOS ripoff filesystem."

You might be able to patent a file system, if you could prove it was novel enough, but one cannot copyright the structure of something (or at least you couldn't until "Look and Feel" lawsuits arrived). Even if Microsoft had wanted to try that tack, DRI could simply have waited to see if Microsoft won, and then sue them for copying the file system of CP/M. After all, until subdirectory support was added to MS-DOS, the file system of MS-DOS was essentially a clone of that of CP/M. Also, since TOS was developed from CP/M-68K, one could also argue it had more right to that file system than MS-DOS! <grin>

Further, I cannot recall any lawsuits, or even warnings over making a compatible file system. If so, all the MS-DOS read/write utilities on the market for non-PC machines would be in danger.

In a message dated 1-30-95, Earl Halliwell said:

"I wonder how exactly we're supposed to reply in e-mail
to someone who neglected to include their email address?"

He probably saw no need to duplicate his mail address as a sig, as
it would be in the message header. In fact, here's how the header
for his message appeared on Delphi's Usenet reader:

From: rh_warre@ece.concordia.ca (Robert H. Warren)
Newsgroups: comp.sys.atari.8bit
Subject: Atari 2600 Tech info
Date: 29 Jan 1995 23:07:09 GMT
Organization: ECE - Concordia University
Lines: 10
Message-ID: <3gh72t$l3f@newsflash.concordia.ca>
NNTP-Posting-Host: kelvin.ece.concordia.ca
X-Newsreader: TIN [version 1.2 PL2]

Note the "From" address in the very first line. (Actually, there was
the "Path" info before that, which I deleted to save space). As I
recall, even reading messages individually (vs. nonstop capture), the
"From" field still shows up.

I suppose the existence of less-capable newsreaders is the reason
sigs came into existence in the first place.

1028. FlickerTerm tech

The Black Box is a really neat device. I have one (but I have hardly had a chance to use it....my computer is in another state (great!) and I'll have to get someone to dig it out of storage and send it..... Anyway... Let me clog up the net with my bullshit (this is probably in the FAQ....so I'm doing an illegal move here by posting...) I will just give you my layman's observations.

The first thing I noticed is that the Black Box isn't black...it's green! That's because you see the circuit board. A case is extra. I like cosmetics, so I ordered the case.

The black box is shaped like the letter T = the single end sticks in the cartridge port/ECI (parallel bus) of the 130XE. The 800XL hooks to it with a short ribbon cable instead. If the 130XE is used, the Black Box gives you back your cartridge slot with one on the Black Box. I don't like using it with a 130XE - this big ol' fragile thing stickin' its end in the slot. I don't suppose you'd have a problem with firm surface to set it on (big desk), but it takes quite a bit of desk real-estate.

The Black Box is expensive, but it is pretty fun. It seems pretty full-featured; The first thing I noticed is that when I plugged it in, my Happy 1050 drive (of course, on the SIO port...not connected to the Black Box) started to HAUL ASS. It did the famous "Warp Speed" at ALL times with ALL DOSses. I don't think Happy was ever able to make it do that. As for the Ultraspeed on other modified 1050s (USD) or the XF551, I haven't tried it. The Happy Warp Speed was neat.

I don't even know how to fully work the BB. There are two buttons on the top. One of them calls up the Black Box menu, from which you can swap drive letters (so you can have more drives than can be physically used). There is a floppy formatter (for the floppy board, of course, which I have). There is a machine language monitor, and you can press the button on the BB at ANY time running ANY program, and even examine the contents of the processor registers!

I only tried the Floppy Board a little, and I don't know if I had things hooked up right. However, what I DID get working was phenomenal. The drives are **UNBELIEVEABLY** fast. They make Happy Warp speed seem slow. I suspect that it reads the drives as fast as is physically possible. Ever pay attention to the tempo of the I/O beeps on the monitor speaker, as each sector is read (who can't with an Atari :) I've always thought they were an EXCELLENT idea. You can audibly discern what is going on (ever get a "device NAK" error? Sounds like hell!). How else would you know that some disks are faster than others? Remember how fast the Happy drive sounds? Hand it double-density sectors, and the beeps slow a bit. The Floppys on the floppy board "beep" the I/O flag in DOUBLE density faster than the Happy can in single - perhaps much so. Plus, the Happy always took a pause to change tracks. The format must be twisted with the Floppy board drives, because I swear you can't tell the drive even HAS tracks unless you listen to the head bump in the drive....just a rapid-fire, uninterrupted blare....it's kinda like listening to a high-performance engine being gunned....IMO.

There's a SCSI hard disk port, although I believe an MFM (RLL too?????) hard drive can be used. I'm going to get that going in the next month or so....I don't know enough about it....and it's one of the main reasons FOR a BB.

Parallel port....optional 64K buffer. If you don't get the buffer, the BB can use your computer's RAM as the buffer.

Hi-speed serial - excellent!! I used it a LOT to transfer files to a PC at 19.2 and never had a hitch.

That's all I know!

James

>does it?
>

OK .. I'm getting a bit confused here as to the purpose of the
original request. When I read it, I assumed someone wnated an
extension of the terminal emulator which would display the control
characters, 0-31, as readable characters. On rereading it,
perhaps the request is to display the IBM style graphics
characters corresponding to these values.

The first depends on the prupose and specific design decisions. I
have seen terminals and emulators which display these characters
as little tiny two letter combinations related to the ASCII
control function .. for example:

f c l d <--- displayed in one character position
f r f 1

^L ^M ^J ^Q <--- control codes

I have also seen emulators that display these codes as hex or
octal strings imbedded in the text, such as <0D> for carriage
return, either mixed with normal text, or including the text as
hex strings (no text at all).

The other problem seems related to how a typical IBMPC based
terminal emulator works. There are several standards of sorts,
but they are mainly grouped by the expression ANSI ... though most
do not conform to the ANSI standard termainl emulation in one way

or another. These seem to generically (in the PC world) be based on the ANSI.SYS driver provided with MS-DOS, and provide the services specified in the IBM and MS-DOS documentation for ANSI.SYS. The incompleteness comes about because ANSI.SYS does not provide anywhere near full ANSI terminalstandard functionality. But meeting ANSI.SYS means that typically the colors and characters would display the same as if the file was TYPEd on an IBMPC running with the ANSI.SYS driver. This generally adds escape sequences to the normal ASCII control functions such as line feed, carriage return, form feed, and tab.

In addition, BBS programs have added sequences for generating musical tones and such. I have never gathered documentation for everything implemented in the IBM BBS world, I just keep looking for more complete implementations of either ANSI standard, or VT100 (which have some overlap). The most complete listing I have of ANSI standard seqquences is in the documentation with the ANSI.SYS replacement, FANSI Console, which is a fairly complete implementation of the standard sequences. Another reasonable complete terminal emulator implementation is the Zcomm temrinal emulator produced by Chcuck Fosberg of Zmodem fame. He does not provide documentation (nor do most IBM-PC terminal programs, a pet peeve of mine) on exactly what sequences he has implemented or detailing their usage, but it seems fairly ANSI compatible.

If one wished to emulate IBM PC terminal programs which are based on ANSI.SYS, one would find at least the minimal set in the MS-DOS manuals. In addition, though, one would need to implement the IBM-PC character set if one wished to be able to display PC BBS based ANSI drawings and such. This would be difficult to do in a tiny character cell.

>others....I do not know how feasible this is. There was once a way of

The reason you have only seen vague references is because no one
ever sat down and actually did it. Yes, it is very possible and
feasible, hardware wise all one needs to do is switch the pinouts
of an SIO2PC type cable around, and wire an additional RS-232 to
TTL type converter for an outgoing COMMAND/DATA linefrom the PC to
the SIO.

The problem is the hardware wouldbe useless without supporting
software, and no-one who has the knowledge/ability to write the
software has seen a personal need (I may be presuming a bit or
overgeneralizing). It is certainly on my own person list of
things to do once I get around to it, but I certainly doubt
whether I will do it anytime before May at the earliest.

Bottom line is still, the hardware would be only a slightly more than
trivial modification/addition to the SIO2PC hardware, but
thesoftware would need to be done from scratch, and does not as
yet exist.

>Axalon boards used a different scheme that most people liked better, I'd
>have to look at my board & see if they patented it or something. The OSS

This is the kind of thing that needs to be more readily
accessible. As I seem to have run across in the last week or two
tearing into my old Ataris and rereading some old text files, the
Axalon bank select was an 8 bit register located at CFFF (or
DFFF??). Simple and straightforward. And nothing wouldbe
patentable about bank selection anyways, at least by Axalon, the
concept was well understood way before the Atari even came about.

Anyone know more precisely about the Axalon interface? My memory
seems to say that the bank select register selected a bank to
appeard in the second 16 K page, 4000-7FFF. I presume a reset
would reset the latch to a known state. Was there an
enable/disable bit, or was the 4000-7FFF region always looking at
the Axalon board?

> I've never heard of the 1802. (Other than the Commodore monitor :)
>Who was this processor by?
>

The 1802 was developed by RCA, who at the time was one of the
leaders and pushers of CMOS devices in general, and I believe the
1802 was the first and for a long time the only CMOS
microprocessor. Harris, who is heavily into satellite stuff, was
a second source, and I believe developed the Silicon on Saphire
version, which was capable of faster clock rates, and more
resaistant to radiation effects.

Some of the attractive (to me) features of the 1802 were the
static clocking of the logic hence you coulddrop the system clock
to zero and save power, since most power is lost during charging
and discharging of capacitances during the clocking. In addition,
it sort of had built in DMA, whereas most other processors
required extra chips for DMA. This enable one to build a
development system with no ROM, just a hex keypad and hex LEDs to
load memory, sort of like the real front panels early 8080 and Z80
systems had (gee...doesn't any _REAL_ computer have a front
panel?) Finally, CMOS logic is very tolerant of a wide range of
supply voltages, though it runs faster at higher voltages. Thus a
CMOS based system can be run on batteries with no voltage
regulation.

Though none of this is at all directly pertinent to this group.

1036. Looking for monitors

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-04 15:47:57 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950204074613.280A-100000@PEAK.ORG>
Source record: 94824

Anybody know where to find a good (but CHEAP) monochrome monitor for use with the XEP-80? I assume this is like the Apple II monochrome (green) 80-col monitor?

Also looking for Commodore Amiga 1084 monitor - this will work with an 8-bit with "split" composite video, as well as an ST, right?

Thanks.

James

>>

As several other people have replied, and to a certain extent with
a bit too much flammage on each side, I merely want to point out
as no one else has that there exists a news group specifically to
help newcomers by answering such questions as how the net works,
and how one should proceed opon reading a news group for the first
time.

The newsgroup is news.announce.newusers. It contains several
periodically reported articles, all of which deal with the history
and etiquette of the Usenet. In short summary, I would only say
what I do when I read a group for the first time.

1) I always read all the messages available on my system.
This frequently will answer my question, if it is one frequently
asked, or at least contain a reference as to where and how to find
the FAQ for the group. The FAQs exist primarily to answer
commonly asked questions, and almost always will have lists of
vendors, or ftp file sites, and such. At the very least, it gives
me an idea of who is active in the group, and what the general
level of technical competance is, which may help in framing my
question.

2) I always remember that no-one who posts here is paid to post
here. In fact, it costs many people here money to even read posts
from me. Thus the key is to be reasonably polite and non-abusive,
or else why would anyone bother taking time to consider my
questions or ideas. Also, I try to remember that many people

react differently than I do to electronic-only contacts. There is a definite lack of visual feedback which can lead to easy misunderstandings. Give people the benefit of the doubt, that perhaps you misunderstood them, or they you, when disagreements arise.

3) Remember that the medium is not instantaneous, though at times it can be nearly so. There are frequently people reading and replying to posts that are as much as a month old. There are also people reading and replying to posts less than an hour old. Many people only check in on weekends, or on specific days during the week. I tend to read daily, when I read, but with frequent pauses of non-access for periods of from several days to a few weeks. In general, it seems a week or so is usually a reasonable length of time for everyone reasonablly active to have read and perhaps replied to a post, that catches those who only read/reply on one day a week, say Wednesdays over lunch, or weekends. So if I ask something and get no replies, I will either assume no one knew the answer, or try rephrasing my question, rather than just reposting it the same way. I will never assume people were being rude.

4) Somewhat less important, but always worth remembering, is that everything one posts goes to literally hundreds of thousands of sites. Depending on the news group, and the readership, this represents a large investment of other peoples time and energies, just to read a post from little ole me. Not so much here, where perhaps the readership could be measured in the hundreds or low thousands, but in some groups any post may actually be costing the world thousands of dollars in peoples time and resources (think about a group read by 100,000 people, and itcosting each of those people only one cent, six seconds at $6 per hour alternative uses of one's time, to read a post ... there is $1000)

5) It is very easy for the inherent anarchy that is the basic rule of the net to overtake a news group. Then the value of any particular group goes downhill real fast, as people get more and more alienated.

Give a read to the contents of news.announce.newusers .. it is interesting.

>>though).
>
>I don't see why HD wouldn't work -- the only macroscopic physical
>difference is the missing hub ring, and the magnetic properties are
>better than DD.

The technical term is the coercivity of the media. Low density
floppies are in the 300 range (280 seems to hit my memory bank)
while high density types are around 600. This means it is harder
to magnetize a high density media, and the circuitry in the disk
drive must supply a higher magnetic field to the disk drive heads.
Thus, a high density media will not work in a low density drive,
as the heads do not, and are not able to, put out a high enough
magnetic flux density.

As to the origianl poster's question, I might suggest getting a
copy of Computer Shopper magazine and picking out a supplier of
your choice. I tend to use MEI from habit (1-800-634-3478), not
sure of current price though, as I only buy once a year or so, but
something like 18 cents each in 500 lots. There are cheaper
though, so pick one for yourself.

Locally, I just walk into Staples or Office Warehouse and buy a
box ... though I don't know specifically that they do indeed stock
360 K DSDD floppies this date and time. But then, I would never
ask for a local source for something like this on the net,
generally getting better and more accurateresponse from people
around here, though I have asked (being in eastern PA) for local
CA sources for things, in planning for a trip to the west coast.

Are you aware that using capital letters in posts is equivalent to
shouting? It certainly is not going to win many people over to
your point of view.

>
>Think about, these are not my opinions, these are opinions of
>other people, tons of people.

Sounds like the opinion of a bunch of people who have immature
attitudes.

Why does every post you make have an "Us versus Them" kind of tone
to it? Are you a part of this news group, or just a transient?

On a personal basis, I tend to have a laise-faire attitude
towards software piracy. I was never caught up in the relatively
massive Atari/Commodore/Apple piracy binge, though I certainly
observed enough of it going on in people around me interested in
computers. It definitely helped contribute in large measure to
the movement of development away from these platforms towards the
IBMPC, but that movement was inevitable anyways. It is also one
of the reasons why game software these days tends to be
concentrated in cartridge based systems. From what I have read
here, a lot of the long term Atari users are very bitter about the
piracy that went on, and the results it had.

As far as the group goes, there is absolutely no way a group of
people can condone piracy of software ... by definition of which I
mean the illegal archiving and copying of software. Any public
access site that condoned something illegal would be opening
themselves up for liabilities.

There is a large gray area of overlap though, where software
companies have faded away, and where disagreements about
whetherspecific rights revert to the author, or whether a magazine

could release thesoftware for further usage. The concensus in this particular group has tended towards a very conservative approach in this area. I realize you are a newcomer to this group, but it was fairly comprehensively discussed just this past fall, and seems to come up for discussion about every 6 months or so. For myself, I think I have no problem supporting the principle involved of not discouraging the current rather fragile level of support for the Atari 8 bit platform. It would seem to be short sited to let a short term enthusiasm and rush of excitement for re-trying old software lead to the death of that platform.

Another reason for supporting a conservative interpretation is that what one is basically doing at least in some form is asking someone else to break the law. Consider it like jay walking, one can certainly do it, and might suggest it to someone else, but it is extremely arrogent to belittle someone else for not jaywalking, just because one is willing to do it personally. You never know why somoene else is making the decisions they are making, but it is their decision to make, not yours.

If you want an archive of old software, start one. Don't expect others to do it for you. Or do what many here do, look for bargains in flea markets or thrift shops ... there are thrift shops in Philadelphia. Look in the classifieds, post your own ads asking for stuff, perhaps get in touch with former computer group members local to you. As an example, coming up in April will be the Trenton Computer fest, the oldest event of it's type on the east coast, if not in the country. Last year I picked up two or three boxes of Atari software there for an average price of less than a dollar a package. Original packages, full documentation and disks. If you have trouble getting there, ask around now at your school, you should find someone who is going.

You certainly shouldn't get angry because people who don't know you, and don't owe you a thing, don't react the way you want them to. That is like getting angry at the sun for coming up in the morning, a very useless activity.

Maybe I shouldn't have been so emphatic on that one....
In my unix-terminal experience, ^L is a signal to the program to redraw
the screen, but not just clear it. When I sent a text file containing
^L straight to the screen, I never get a clear-screen.

> disk drives?
>4) Where can I find someone to upgrade the memory and repair my
> XLs and XEs.
>5) Where can I find someone to perform the Super Video upgrades?

1. I happened upon a sale at the university bookstore where they were
selling double density disks (as opposed to high density ones)
for 4.5 cents each. I snatched up about a hundred of them.
Also, about two months prior to this, I posted a request in
the local for.sale group (utah's) asking for double density
disks, and I found someone who sold me a whole boxful for
about $0.10 each (these had been used years ago for a PC).
Look around. Patience will bring dividends. I now have
200 or so blank disks that will last me the rest of my life.

2. I think that there are cables available that turns 25-pin RS232 to
9-pin RS232 made for the PC, but they would probably work for
the Atari's 850 or P:R: or whatever. I got my modem cable
about 8 years ago when I bought a P:R: connection used for about
$30 or so. I haven't needed to get another one so I haven't
kept my eyes out for it. Printer cables might be more difficult;
try the big vendors in the vendors FAQ (Best, B&C Computervisions,
American TV, Toad, etc.).

3. I have been fortunate in that my disk drives have never given me any
trouble. I have an Indus (bought new about 8-9 years ago) and
a 1050 bought used about 5 years ago. If they go out on me,
though, I'm up a creek as well. :(

4. There's nobody around where I live to repair anything either. Look in
the Upgrades FAQ (posted a few days ago) that talks a little about
memory upgrades. You might find these with the vendors mentioned
above.

5. Ditto #4.

>Honest to God, not a *single* (zilch!) person replied. NOT ONE!!!!!
>I'm not asking someone to enter a long-winded post and write a book.

I usually don't post responses because I figure that everyone else will, and I really don't like to duplicate effort. It's not that I don't care; I do, and I try to help out when I can. I have enjoyed using the Atari 8-bit for 10+ years and will continue to do so. I'd love to sit down and code some of the ideas for cool games that have been wandering around in my mind for years now, but with school and Robert Jordan and Tad Williams and other books to read my time is not as plentiful as it once was.

Someday I will sit down and write stuff, and I will do it for the fun of doing it, not for a profit.

Which brings up a question. Was this with the composite output,
or the luminance one?

I was just sorting thru my DIN to RCA cables to see what I had and
how it hooked into the Atari, and tried my 800 with my TV direct
video input. Nice picture from the composite output, definitely,
but for interests purpose, I hooked the luminance input up, and
low and behold, quite a bit of color in the display. I expected
straight B+W. Which would I be better off using with a B+W
monitor? (I have not as yet looked back at the print in the Tech.
Manual to see what I can see)

>ST. Wouldn't that be a neat trick??
>

Two basic approaches, one relatively more common than the other.

First, bear in mind that (I assume) the extension is on a 34 pin
ribbon cable, of the type used for most floppy drives.

So the straightforward approach is to use chassis mounted 34 pin
ribbon connector plugs and sockets, cut your custom holes, and
clamp your custom cables. A common source of parts would be
Digikey (1-800-344-4539) though there are many others. You are
entering the hacking area, and the results will depend completely
on your personal abilities to build or find parts.

I don't like external ribbon cables (which are very noisy RF wise
... which is why you don't see this commerically much at all), so
on a personal basis I have standardized on 36 pin Centronics
printer type Amphenol Blue Ribbon connectors. Patching them to
ribbon cable is tedious, but easily doable, and there are some
plugs of this type that will clamp down on ribbon cable.
Externally, I use a custom wired cable of twisted pairs, each pair
carefully matched with the opposing ground. The first
installation of this I used the extra pair of wires for a reset
button, though the recent installtions have wired them to +5 and
+12 with a switch so as to be able to tap external power for the
drive. I have never used this power source though, mostly having
local power supplies for the drives. I think many of the
commercially available Centronics to Centronics printer cables
are twisted pair type, though one should not take that for
granted.

Though it's hard to argue with the ease of snaking a ribbon cable
thru a small crack in the case, and hooking up directly with no
disconnectable (without disassembly) connectors.

"Unfortunately those non-internet types on the PRO! network complained
so much about the internet messages, that Im bagging the whole idea.."

Well, I complained, and as a sysop like you who runs PRO!, it did not
stem from any ignorance regarding internet, as I am here typing to you
just fine, and this should nix that mind-set. What you did was to dump
about 5-6 messages (the headers took up most of the space) into the
Atari 8 bit sig on the PRO! net. While it wasnt a bad idea Jimbo, I think
you misinterpreted what people were saying to you. There was a call for
you to keep these USENET messages separate from the PRO! atari 8 bit net.
This is because the scrolloff in a PRO! message area is only 250 messages
and we generally turn over old messages within a week and a half. Adding
more people to it would also flip it faster. It would have been better to
make a new area devoted to this sig, and then the turnover would be less for
each area. Another issue of course is that we would have trouble if we
wouldnt be able to automate distribution of cross posted messages..
If you were going to take much of your time up to move messages back and forth
between the networks, I can live with it... But Id love a separate base..
The same people would be in the separate base, but it would keep the locals
whove talked to each other in a smaller traffic area, within reach of each
other...

I am a part of the whole thing not only of this n.g. Actually
i keep track of about 90 n.gs. Why "Us Versus Them" because
this is basic method of learning something. LIke in your
childhood when your mother wanted to teach you how to use spoon
she showed you how to do that. SO, i am showing you peope who
do thing differently.

*n.g. - newsgroup

: of the reasons why game software these days tends to be
: concentrated in cartridge based systems. From what I have read

What makes you thing so ? Have you ever seen cartridge for IBM or MAC ?
All games fo SEGS, NINTENDO (i am not shouting :-) etc just tha
kind of game that you can play for a week and that you hate it (certain
exceptions applied) and this is just perferct method to suck money
from parents of little kids. If that paresnt were a bit smarter they
would buy something like 386 for games or at leasy 8bit stuff like
C64 or ATARI. It is cheaper and more enterntaining.

: here, a lot of the long term Atari users are very bitter about the
: piracy that went on, and the results it had.

Why ?

: As far as the group goes, there is absolutely no way a group of
: people can condone piracy of software ... by definition of which I

again Why ? Are they bone brained ? Like 100 years old they can't
(or afraid) change a thing ? What about C64 and ZX users ? They

did it ! They changed everythinh and so far everything is just fine.

: approach in this area. I realize you are a newcomer to this

not really. I just started to thin about again and couldn't help it
to raise the question again.

: group, but it was fairly comprehensively discussed just this past
: fall, and seems to come up for discussion about every 6 months or

and it will ...

: so. For myself, I think I have no problem supporting the
: principle involved of not discouraging the current rather fragile
: level of support for the Atari 8 bit platform. It would seem to be

It is normal level of support. Not more not less than for ZX or C64.
(yes yes US vs THEM (no shout) again)

: Another reason for supporting a conservative interpretation is

Where are we ? In Britain ?

: that what one is basically doing at least in some form is asking
: someone else to break the law. Consider it like jay walking, one

No. I am asking to take something that belongs to us. To do something
that has been done by others several times.

: If you want an archive of old software, start one. Don't expect

I can't open any internet stuff (i am poor student) but i did
open my BBS. And I am working on ATARI stuff.

: others to do it for you. Or do what many here do, look for

Not For Me ! For everyone !

: bargains in flea markets or thrift shops ... there are thrift
: shops in Philadelphia. Look in the classifieds, post your own ads

Thank you. Thank a lot. I din'y know about that and will check that out.
BUt still it does not change anything.

: You certainly shouldn't get angry because people who don't know
: you, and don't owe you a thing, don't react the way you want them

I am not angry. I just trying to understand why you people doing things
hard way if it could be done better.

: to. That is like getting angry at the sun for coming up in the
: morning, a very useless activity.

No itis not. If you get angry for the sun for coming up in the morning
this i a sign that you should close the certains.

YOu said that it will kill poor atari platform. Well, firts of, it did not kill C64 and ZX (Amstrad alive in europe). Second, i have to repeate myself 4th time, if the soft for ATARI would be free people would return to ATARI more active and vendors will compensate their loses on soft selling hardware. Maybe i am wrong but who really cares. People will continue buying hardware almost forever. But remember, ATARI is dead and number of machines getting smaller and smaller. So, there will be time when only a couple of antique stores will be selling ATARI.

Artem.

Shouldn't that be double f1,f2; ??? If you're converting from ASCII to floats, using atof(); I would have thought they should be.

But then again, atof shouldn't take 2 parameters - atleast the ANSI atof() doesn't - it's: double=atof(char*);

Tell me, Craig (self righteous, self-appointed master of the Pro!
network), how the HELL are you supposed to let folks SAMPLE internet
messages, if they are inaccessible to an existing message base?

How do I CREATE a separate Internet message base and STILL let folks
sample network-wide? It's impossible! So, as you see -- I HAD to
post them to an existing base -- and what better place to post than
the Atari 8bit base!

DUH!

Secondly, NOT ONE FREAKING PERSON offered to help create a patch to
remove the headers from the Internet messages.. All I got were
complaints from a bunch of small minded morons! The Pro!
network is a total failure -- as there are far too many self
righteous, self appointed message censors/critics to make it
enjoyable!

I went WAY out of my way to port the messages from csa8 to the Pro!
network.. Even offered to pay Bill Bingham to code his QWK program
to automate the process for me. Did anybody offer to help? NOT A ONE!
Did anybody offer ANYTHING? NOT A ONE! Instead, I got a bunch of
foul mouthed complaints!

Ken, to the best of my knowledge, ST Xformer does not allow for direct file transfers. I think it had an add in program or menu or extra device handler (F: from the DOS menu????) so what you would do is boot up the emulator with a 1050 attached, go to DOS & copy to the F: device & the file would appear on the ST disk as a file rather then a virtual disk. There was also a program that would load a file list on the one side of the screen with the contents of a virtual drive and one on the other side with the contents of the ST disk. You'd then select files & transfer them in or out of the virtual disk to the ST disk. The file transfers were very manual to say the least compared to how most people seem to want them done today. Seems like everybody is talking about the equivalent of a LAN with mixed computers on it sharing files! It'd be great if it could happen, but gauwd the work it would take. For simple file sharing it wouldn't be to bad, but the first time the Atari would jump through CIOV or SIOV or DINV with a buss command the others didn't understand. If the software does something like sends out a set drive parameters, how would you handle that? Just ignore it maybe or have one and only one of the computers send out a NACK? Maybe I'll spend a day or two in C on my clone & see what I can come up with. I think the only problem with SIO2PC is Nick is such a man he only programs in assembly. If I can knock out a couple of lines of code in C so a few other platforms could look at it *maybe* something good'll happen.

Actually, there's no HSCROL involved. Flick uses a separate
character set and display list for each page.

> On the PC, 0-8 and 14-30 are characters.

It was my understanding that IBM assigns graphics characters to
EVERY code from 0-31.

> Maybe I shouldn't have been so emphatic on that one....
> In my unix-terminal experience, ^L is a signal to the program to
> redraw the screen, but not just clear it. When I sent a text file
> containing ^L straight to the screen, I never get a clear-screen.
>
> ------------ R o b F u n k ------------|------> Funk.17@osu.edu

Yikes! Never extapolate what UNIX does to anything else in the
universe. ^L is the ASCII Form Feed character, interpreted by
convention in full-screen terminals as a clearscreen command.

> 1) Anyone saw the XEP80 working under SpartaDOS X 4.20 with its XEP
> -driver?
> On European, PAL-computers it does not work at all. But I can't
>
> Konrad Kokoszkiewicz
> conradus@plearn.bitnet

The Sparta XEP driver leans VERY heavily on the NTSC system clock to
maintain proper timing with the XEP. As a result, it doesn't work on
PAL systems.

>
> Has anyone suggested that the author of that program make the
>portion of the program that produces the display into a driver loadable
>at startup, and useable with BASIC, etc. (programs that use the E:
>device)? It should be possible...perhaps even rather simple.
>
>-Joe
The display driver is _really_ simple; it's about 12 bytes or so.
I wrote a display VBI (but no E: or S: handler). All it requires is this:
Flip the DL LMS address to the second screen; then scroll half a character.
Since fine scrolling is active, each screen line requires 48 bytes.
You could avoid this by using multiple LMSes, but that would require
multiple changes. My version had the two screens 5 pages apart; the routine
went like:

```
LDA DL_LMS_HI
EOR #5
STA DL_LMS_HI
LDA SCROL
EOR #4
STA HSCROL
RTI
```

The default Atari character set looks kinda neat in FT mode; a fair bit of
kerning. And I didn't discover that just because I forgot to point CHBASE to
the new set. No... it was.... er... Intentional! Yeah, that's the ticket! ;-)

The best place to go for that would be the Atari Tech Ref manuals; it's all there in gory detail. Probably the most valuable resource I've found; a pity that you have to read it cover to cover twice to get the feel for it.

I know you can connect an 810 or 1050 to an IBM by using a plug-in
board called a GEMULATOR, I believe it is available at some Atari Dealers.

It actually allows a PC to emulate an Atari ST but you can use the
supplied XFormer utility which allows the ST to emulate an 8-bit Atari.

Neat huh! PC->ST->8 Bit.

I think the price is around $99.00.

I've tried it and it works.

Try ftp - atari.archive.umich.edu, or gopher gopher.archive.umich.edu.
Go to the Merit Archives, then Atari, 8bit, then I think it's graphics.
There are GIFs of a bunch of different software.

There is someone in Germany who has produced a "Cart to PC Bus" device, and
apparently has drivers for a Herc card (including the printer port). I'll
see if I can find the info and re-post it. But if Herc is possible, then
an 8-bit VGA card might be too.

Yes ... and bear in mind not interpreted at all on a lot of VT100,
ANSI, and such newer dumb (what a misnomer!) terminals. People
got carried away with making everything escape sequences, I
suppose. Some dumb terminals interpret it as merely a home
(which is really dumb, in my opinion). The ASCII says form feed,
which means to me something like new page, so I would at least
expect a blank screen and cursor at top left corner, as most
implementations do. It does generally get interpreted as a
clear screen (actually, clear screen and home) on most IBM based
terminal emulators.

Just a chance, but could they be talking about IBM code-page tables?
For instance, if you do something like:
FOR N=0 TO 255:? CHR$(N):NEXT N
You get some of the lower ANSII stuff like <TAB> & <BELL> but along
with that you get something like:
1=>happy face
2=>inverse happy face
3=>heart
4=>diamond
5=>club
6=>spade
11=>symbol for Mars or male
12=>female symbol
24-27=>arrows i.e. <esc><ctrl>= on an Atari
I've seen this type of stuff appear on ANSII bbs's & it's possible they
need that stuff. I've seen places where they use stuff like:
<arrow>main files
mail bye
back E-mail
W/O the lower codes, the "You are Here" menus are a little hard to follow.
Rick

ASCII was designed for paper teletypes, not screen displays, so
I don't think it's too productive to follow ASCII control codes to
the letter.

>implementations do. It does generally get interpreted as a
>clear screen (actually, clear screen and home) on most IBM based
>terminal emulators.

All terminal emulators emulate a _terminal_, not a paper teletype.
And they usually specify which terminal they're emulating, vt100
and ANSI being the most common in the IBM world. (I think ANSI
is just vt100 with color and different arrow-key codes.)

What you need to do, then, is decide what terminal you're emulating,
and get the specs on that. Don't rely on ASCII specs. Get vt100
or ANSI specs. They should specify exactly what you want to know.

Message-ID: <3h3cuc$1d6@camahueto.inf.utfsm.cl>
Source record: 94722

Hola mundo.

I have just uploaded "Line-Up" game into the Atari Archive
at UMICH, in the "New" directory.

It's name is LINEUP.DCM (in lower-case) and must be processed
by the Disk Communicator 3.2 to recover the enhanced density
bootable disk.

Here is the .txt file also uploaded:

- - - - - - - - - - - - - >8---------------------------------
LINE-UP

(C) 1994 by Nelson Ramirez,
Puerto Montt, CHILE.

Another GAME of the *tris series.
It is a public domain version of the
arcade game of the same name.

This is one of the most interesting
and well-done games I've ever seen
(of this style) for the 8bit.

You have to reduce (kill) the falling
blocks storing them in a line of
three (or more) of the same type.

To finish a level, you have to reduce
a required number of units/lines/
diagonals/???.

Diagonals gives you more points than
other lines, as well as lines of more
than three units (blocks).

There is also a bonus score for final
height.

You can use SHIFT key to change the
falling triad, up to two times in a
level (but you will loose your
height bonus).

It has many different levels
(and many hidden levels, where you
can jump to another levels!).

There are special blocks that are
bombs, time-stoppers and others.

Great sound and animation.

Nice presentation with a digitized
track. Then, a Spanish scrollbar is
displayed with another good
composition.

It requires an XL/XE Atari with 64K,
a standard joystick, and an enhanced
density disk drive (1050).

HAVE FUN!

Victor Parada
Valparaiso, CHILE.

From: kendrick@zippy.sonoma.edu
Message-ID: <3h3h2m$l5v@nic-nac.CSU.net>
Source record: 94725

If you want C for the Atari, there are a few. Some are PD/Share/Freeware and available via gopher (gopher.archive.umich.edu), ftp (atari.archive.umich.edu) or e-mail (atari@atari.archive.umich.edu ; "help" in body of message) at the Atari Archives in the Merit Archives at the University of Michegan (sp?!). (atari/8bit/Languages).

If you want a C/Pascal-like language, go for Action!, available on Cartridge. It isn't produced anymore (except I think FTe is putting it in Mars8 along with other OSS languages) but I saw it once (the other week) for sale, used, for THREE DOLLARS(US)!!!!!

Also, there's of course BASIC (built-in), TurboBASIC XL (at the Archive: tbasici.arc (interpeter) and tbasicc.arc (compiler and runtime runner), BASIC XL and BASIC XE (cartridge, I guess XE is coming with Mars8?) and a few straggling BASICS (A+, MicroSoft II, etc.).

There are a number of PD/Share/Free and commercial 6502 assemblers (and the Sweet16 is coming with a 65816 assembler, but I'm guessing you won't need that yet :)). Mac/65 is no PD(?) I think (at least the PC Xformer-compatible version), and there's A65, MAE, and probably a few others (I don't do assembly (yet)).

There's Quick which is a (little hard to use) Pascal/C/Assembler type language available on disk from Germany (Power Per Post as well as from UK and/or US dealers; check the Vendors/Developers list). It's just a little slower than Action! for whatever benchmark they tested, but is supposedly great for games (has built-in DLI/VBI access; I've found the DLI routines I picked up for Action! are a bit on the unstable side, unfortunately.)

There's also of course a few Pascal (or at least one; the one I saw I REALLY couldn't stand; horrible editor - but now that I have a RAMdisk and SIO2PC setup, perhaps I can just jump back and forth to TextPro or something) packages, as well as Forth and Logo. I know very little of these.

I'm sure there's more, but if I were you, I'd stick to the basics:

BASIC/TurboBASIC XL (stuff everyone can get ahold of)
Action!/Assembly (for speed; just compile the stuff and you're fine :))

I personally do Action!/TBXL but as I implied with that (yet) up there, I'll hopefully get down to some Atari assembly some time soon. (I know some 68000 but that doesn't help me, I have no Mac/Amiga/ST's (yet! :)))

Good luck! Have fun!

Craig,

The FTe BBS has been down for the past few months, and has never really been "networked".

I've found that it's much more enjoyable to simply log onto the Internet and/or the Fine Tooned Product Support area on Genie.

I've seriously considered just setting up a CPM BBS, as the CPM Community is much more respondent to releasing source code, and actually encouraging people to "write modules" in the same spirit that Express! was originally, and HeathKit did with encouraging people to build their own computers.

Just had to whine a little... <grin>

Mike

Hi!

I've got the following items up for sale or (preferably) trade. There are
no prices on anything. If you see something you like, make me an offer!
I've just got a couple of rules:

==========
1. Give me a couple of days to decide who gets what. On really popular
items, it's only fair to give everyone a shot.

2. If you're from the USA, please pay by postal money order. Canadian
banks put a fifteen day hold on US cheques.

3. No items will be shipped until I receive money or the trade item. You
can understand why.

4. You can choose whatever shipping you want ... surface mail, air-mail,
UPS. I would recomend UPS because it's insurable.

5. I reserve the right to refuse specific offers (even if they are the
highest offer) in the event that the person is likely to resell at a
higher price. I *REALLY* hate people who gouge their prices!

6. When paying for an item, please include both your snail mail and
e-mail addresses in the envelope. Thanks!
==========

Atari 2600 Games
==========
With instructions, no box.

- "Secret Quest"
- "Winter Games"
- "Star Raiders" (includes touchpad & overlay)

Atari 2600 Games
==========
No box or instructions.

- "Pac-Man"
- "Kangaroo"

Atari 7800 Games
==========
With box and instructions.

- "Galaga"
- "One On One Basketball"

Atari 7800 Games
==========
With instructions, no box.

- "Super Huey UH-IX"
- "Summer Games"
- "Impossible Mission"
- "Fight Night"
- "Touchdown Football"
- "Food Fight"
- "Hat Trick"
- "Real Sports Baseball"
- "Centipede"
- "Karateka"
- "Choplifter!"

Atari 7800 Games
==========
No box or instructions.

- "Dig Dug"

Sega Master System Games
==========
(With box & instructions)

- "Global Defence"

- Sega Master System Light Phaser

TRS-80 MC-10 Micro Color Computer System
==========
- Includes computer, power supply, hook-up accessories, 16K expansion module, instructions and dust cover.

Freebees:
==========
I'm willing to throw these for free if anyone makes an order.

- Colour Computer 3 Extended Basic manual (French version).
- Colour Computer 3 Quick Reference Guide (French version).
- Instruction Manual ... "Scrapyard Dog" (7800).

Stuff I'm looking for:
==========
(I'm willing to negotiate on an individual basis, so that we can come up with a deal that's fair to both parties).

- Atari Lynx Games
- Tandy Co Co software
- Sega Master System Games
- Atari 7800 Games

Just let me know what you have, and I'll let you know if I'm interested! Thanks!

You definitely can't do Sparc assembly on an Atari, but you'd probably find 6502 assembler easy to learn. Compilers for Pascal and C are available at atari.archive.umich.edu, but most serious Atari programmers recommend Action!, a language sold in cartridge form by Fine Tooned Engineering (see the Atari 8-bit Vendors List, posted regularly in this newsgroup).

You know Rob, if you wanted to do it via a 2nd PIA, it wouldn't be
that tough to get it wired into the Axalon area. That way any software
such as SDX or Letter Perfect or what have you would just test for
Axalon expanded memory, think it was running on an 800 with an Axalon
board & go ahead determining the size. I'll go ahead & post an eight bit
latch on the buss design & take a crack at what the logic is to get things
on an 256k 800xl to look like a 128k Axalon board is plugged in. Probably
a trivial design effort that will take more time to do an ASCII schematic
then the logic for. I have one spare 800xl that I may even get around to
modifying. I know some of the German 800 hacks allow for 1 meg. May be a
worthy waste of time <g>.

> drive both ways?

I dusted off my Indus, powered it on and checked. Looks like both of you
have half of the solution;

- 1a is single
- 1b is double
- 1c is enhanced

The best way to check for SURE is to put in a diskette where you KNOW the
density and compare the displays. Unfortunately I can't do this since I
have misplaced my cables box.

New facts about the BlackBox

(c) Erhard Puetz November 10th, 1994

This article has been written for the ABBUC magazine. It may be freely distributed but not changed in any way without the authors consent. (Translated by Mathy Van Nisselroy, December 19, 1994)

Some time ago, I printed a letter using StarTexter (Mathy: a German Wordprocessor). I just had bought the BlackBox and therefore played around with it a lot. The transfer from data to the printer struck me as taking very much time. And this with my nice Laserprinter. I prepared a Test text with StarTexter. This ment, totally filling a page. E.g., 79 times the character "A" on a line, with 66 lines.

Printersettings; 12 cpi, Left margin 10, Buffer 10kB.

So, off with the text, stopwatch started. WHAAAAATTT, 14 seconds?!?! This can not be true. a) the BlackBox provides parallel datatransfer, which should be about 10 times faster than serial datatransfer (No Start- and Stopbits, and eight bits are send at the same time) and b) there is a 10kB printerspooler. So that handfull of characters should have flown to the printer in no time. But whatever I tried, nothing helped. So I read the technical page of the printer manual. It says: After a dataword arrived at the interface, the HOST, in my case a 130XE, has to wait 0.5 us

and then activate the STROBE-signal, for at least another 0.5 us. Then the printer needs approximately 10 us for the processing, which adds up to 11us. Which means that the printer is able to receive the above mentioned 5280 characters in approx. 0.06 seconds. The difference between 14 seconds and 0.06 seconds was a bit much for my taste. 1.2 seconds (or twenty times 0.06 seconds) should be about enough for the 130XE I thought, we do have to call CIO, which calls the parallel bus and then there are some read and

write operations. Well, some of you might think, why is this guy passing his pants for 14 seconds? Easy. Now write a letter with Daisy Dot III. Two pages. That should be about 250 kByte of data. This would take about 7 minutes to transfer, but that's just the transfer. Add to that the time Daisy Dot needs to convert. And Daisy Dot can not convert while printing, so a slow datatransfer really slows down the system. You loose a quarter of an hour for a stupid letter, you could have written by hand in the same time. Since my XE should be able to transfer the data ten times faster, the only remaining source of error seemed to be the printer. So what does this idea do? I wrote to EPSON, raging around about their not so cheap printers being lame. They, being far from stupid, run a small test program under my conditions (text 66 x 80) and achieve 0.14 seconds transfer time. So that's it. Maybe I SHOULD buy a PC.

One fine day I got the idea to try the whole thing with my old Wiesemann Interface. Ready, GO. Measured time: 8 seconds. Say what? Whattheheckisthis? The ancient interface is faster than the BlackBox? So, at it. Letter to Robert Puff. Including return-postage. No answer. Via Internet. No answer. Via the ABBUC BBS. No answer. Fax. No answer either. (Bull sh*t!). I can't see through this BlackBox. Looks complicated. I'll have to accept that.

And yesterday I came to the conclusion that I'm not gonna accept it. So I delved into the operation system of the BlackBox. Looking for what? For a $40 for the printer in DDEVIC = $300. To my own suprise, I found it relatively soon. The reassembling then took quite a bit of time and brain power, but below you'll find the listing I want to talk about. The actual printer routine starts on page 4 in line 2370 with the label IOV. Boldly speaking you could say that it checks if the BlackBox. Looking for what?

For a $40 for the printer in DDEVIC = $300. To my own suprise, I found it
relatively soon. The reassembling then took quite a bit of time and brain
power, but below you'll find the listing I want to talk about. The actual
printer routine starts on page 4 in line 2370 with the label IOV. Boldly
speaking you could say that it checks if the printerport of the BlackBox
will be used. In case the answer is "YES", the data will branch to either
send data directly to printerport or save data in a printerspooler. The
printerspooler can either be RAM inside the XL/XE, or extra RAM on the
BlackBox itself. If the spooler is used, as much data as possible will be
put in. As long/soon as this is less than approximately 60kB of data, the
computer will be freed up to do other things and you can even leave you
wordprocessor or whatever and load other files. The data will then be send
from the spooler, per timerdriven interrupt, at about 173 characters per
second, if I got my calculations right, to the printer till the spooler is
empty. But the slow datatransfer happened without the spooler, so the
direct printer routine is the one we need to look at. The most important
part you'll find at page nine. And only after a long time I saw what
really stood there, in line 4940. It says: BNE WR_OK, which when
translated reads, the computer should wait, as long as the printer is
ready. This is baloney. It should read, wait as long as the printer is
NOT ready. So it should say: BEQ WR_OK. I've tried that out immediately.
Once with the original, once with the corrected bug and once with changed
STROBE-Timing (Lines 4780 and 4840). All this using Turbo-Basic and
BW-DOS:

(Mathy: BW-DOS is a SpartaDOS compatible and written by Jiri Bernasek of
BEWESOFT.)

10 DIM A$(66*80)
20 A$(1)="A":A$(5280)="A":A$(2)=A$:REM fill A$ with 'A's.
30 FOR I=80 TO 5280 STEP 80

( UUCP Dialup connection )

Germany [+49+5439+3265]

40 A$(I,I)=CHR$(155):REM the 80th char in each line is an EOL
50 NEXT I
60 OPEN #1,8,0,"P:"
70 TIME$="000000"
80 ? #1;A$;:?TIME,TIME$
90 CLOSE #1:END

Here are the test results:

- originally the printout would take 664 jiffies = approx. 13.28 seconds
- after the first change 118 jiffies = approx. 2.36 seconds
- after the first change & DMA OFF 87 jiffies = approx. 1.74 seconds
- & new STROBE timing 95 jiffies = approx. 1.9 seconds
- & new STROBE timing & DMA OFF 71 jiffies = approx. 1.4 seconds

With th new operating system of the Black BOX, the BB Enhancer:

(Mathy: this probably goes for the Floppy Board as well, since it also
contains the BB Enhancer.)

- after all changes 102 jiffies = approx. 2.04 seconds
- after all changes & DMA OFF 75 jiffies = approx. 1.5 seconds

Wow, really cool to see that data zap to the printer. And I was really
surprised about how close my estimated 1.2 seconds came to the 1.4 seconds
it really took. I'm happy. But also suspicious, this might not be the
only bug Robert Puff left inhere. There always is the possibility of a
serious bug hiding somewhere. On the other hand though, the BlackBox has
been working for me for a very long time and doing very good. I've got to
make a few remarks here. The new STROBE-timing now takes approximately 7
us, about 10 times more then the printer needs. BUT this works on MY
printer. How this works out for other printers, I don't know. And then
something I've been talking to many people about, including Robert Puff,
who even happened to have time for an answer. I said, or bettter yet
```

Germany [+49+5439+3265]

opinion. When a 155 appears in a picture, the interface changes this into
a 13, resulting in an error in the picture. It's even worse if a LF is
added. In that case, the printer will not receive the amount of bytes
announced in the graphics data command, e.g. 641 bytes instead of 640
bytes, confusing the printer. For the interface has no way of knowing if
it's converting graphic or text data. Let's look at page 6, line 3120 and
following. There it says; take a character from the buffer. Is it EOL?
If yes, convert it into CR. Which creates an error if it's graphics data.
And there are so many commands for graphic print-outs, that an interface
would have trouble recognizing all of them. What if one sends downloaded
charactersets to the printer? It's been 10 years ago already since I first
found this error. At that time, I had just written a driver, that would
pass-through all ATASCII characters when printing a BASIC listing. The
special characters where send to the printer as graphic data. The
character Ae (upper case character A with two dots over the A) always made
trouble. When I looked at the graphics data a bit closer, the value 155
actually showed up. I then changed the character in such a manner, that
154 or something related came out, it worked.

Last remark. The operating system of the BlackBox has a checksum. At
least with the Enhancer, the change did not stay unnoticed. It always
beeps for a second, when I open a certain menu (no food on this one). But
maybe good old Robert will get his hands on an ABBUC magazine.

So that's it, goodbye and thanks for all the fish.

: >any reason why the Atari can't FTP, Telnet or Mail? Where can I get a
: >documentation of the TCP/IP protocol?

: I think this might be within the realm of possibility.
: For TCP/IP protocol info, you'd want to look at the relevant internet
: RFC (I don't know which one). If you can do WWW, there's a pointer to
: the collection of RFCs at http://www.cis.ohio-state.edu/

i'm working on a slip, tcp/ip driver for the atari, slip is working,
and i am able to receive/send IP packets, currently i'm implementing ICMP,
my first goal is to let the atari answer to ICMP-echo requests (ping).
i'm _trying_ (not sure if its possible, need a lot of memory) to implement
it as a device driver (N: or something), so you can do things like:
OPEN #1,8,6,"N:193.67.138.41,23"
to open a TCP connection to 193.67.138.41 port 23.

anyway, my atari already has its own IP address, 800xl.xs4all.nl,
hopefully, someday, when you telnet to it, you will see something like:

Trying 193.67.138.42...
Connected to 800xl.xs4all.nl.
Escape character is '^]'.

ATNET SP-DOS (800xl) (E1:)

login:

:-) (if i ever get that far...)

for information about the low level internet protocols,
read the following (among others) RFCs:
768 UDP
791 IP
792 ICMP
793 TCP

1055 SLIP
1144 SLIP HC

Charles..

1116. Clock Chipping mods for 8-bits?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-06 06:57:13 UTC
From: davew@pacifier.com
Message-ID: <3h4h89$fh2@news.pacifier.com>
Source record: 94740

I have some old 8 bit machines that I have suffessully replaced RAM to faster speeds. Now that these golden old 1200XL/130XE machines run can I clock up the processor or replaced the 6502 with a faster clocking CPU?

I was wondering if anyone has done so. I am a bench technician for the Mac and IBM PC, am familiar with changing simple circuits, but would like to hear from other who have succeeded.

Body handling: HTML body converted to readable text

This is one of those 6 of one, 1/2 dozen of another things. You can use a device with less I/O like a 74LS74 & it will have an pin that can be wired with a resistor/capacitor to reset itself everytime you boot the computer or go with something like the 74LS374 which has eight latches in a 20 pin device, but no reset pin. You only need two devices if you do this in a cartridge port since the $D500 !CS line is already in there. No additional decoding chips are necessary.
Tie the 8 data pins of the '374 [3,4,7,8,13,14,17,18] to the Atari's data lines. Power & ground go to pins 20 & 10 respectively. Tie the NOT Output enable, pin 1, to ground. The other chip you'll need is a 74LS02 quad input NOR gate. Really if you want, any NOR gate like the 74LS27 triple NOR could be used if you just tie the extra input LOW. For a 74LS02, tie pin 14 & 7 to Power & ground respectively, tie all unused inputs to ground, pins[5,6,8,9,11,12] & don't attach the outputs [4,10,13] to anything. Tie pin 2 to the phase 2 clock, usually this is represented by a 02 where the 2 is subscript. Mapping the Atari has it listed as PHI2 and B02 or pin S of the cartridge port. Tie pin 3 to the CCNTL or CCTL as it is called by Mapping, this is pin 15 of the cartridge port.
Now all that remains is to tie pin 1 of the 74LS02 to pin 11 of the 74LS374 which is it's clock pulse pin.
What happens: sequence runs something like this, 1st the 6502 sends out the address it will use, in this case the CCTL is decoded so it goes low everytime there *ANY* address in the $D500 to $D5FF area. After the address lines settle the processor then puts the data on the line. The phase 2 clock is just a signal that
switches from a high to low state when the data lines have had time to stabilize. The phase 2 clock & CCTL lines are both going through a NOR gate so when the CCTL goes low, meaning an address in the $D500 area, and the phase 2 clock goes low, meaning good data available, the output of the NOR gate changes state & clocks all 8 bits of data into the 74LS374. Now everytime you write a bite into the $D500 area, the '374 will echo it. Anyway, the punch line to all this is I was always amazed at the supercarts & some of the newer banked switched carts so I looked into it. Now that I've figured it out, if anything, I'm a little disappointed. Arthur C. Clark was right! It would be a trivial exercise to bank 64k of cart. With a lot of decoding, you could bank 2 megs. I've already given away the cart with the built in octal latch. I should of done some other stuff first, like see if a read to $D500 latches data the same as a write. Anyway, I will do the XL to Axlon hack. The only difference between the cart I described Axlon bank decoding addresses.

$FC0-$FFF=>0000111111000000-0000111111111111
=>0000111111xxxxxx are significant
$CFC0-$CFFF=>1100111111000000-1100111111111111
=>1100111111xxxxxx are significant.

If my logic serves me, that means something like an 8 input NAND gate with an inverter, a 74LS00 NAND gate, an unused NAND gate serving as the inverter & a NOR function on a 74LS02 will take care of the 2nd case. An 8 input NAND with only 6 inputs used the output inverted, a 4 input NAND with the extra gate used as an inverter, & another of the NOR's unused gates would take care of the first. Sounds like a total of about 6 chips when you throw in the latch. I'll have to burn a few more brain cells on this, doesn't seem like I should need 6 chips to make this thing work. I may be able to use the 2 unused gates in the 7400 & 7402 to eliminate the quad NAND gate. I may even try to get the R/!W line in here so it'll be XL OS compatible.

Right and wrong, memory cycle time is the thing to compare, however
the 6809 only access memory at 1/4 the processor-clock.
That was the main reason for me to conclude that 6502 is more efficient.

To all wondering what happen to Warp 10, wonder no more. I have moved and therefore, have new phone numbers for the system. The system will go multiline just as soon as I get my hands on a 250 watt PC power supply, which will be used to power the three keyboards for the system.

Warp 10 Line 1: 612-221-9895 - 300-14,400 baud.
Warp 10 Line 2: 612-221-0815 - 300-2400 baud. This slave is **NOT** yet operational, but the phone line is. I hope to have line 2 going before the end of the month, and will give notice when operational, so for the time being, stick to line 1.

One of my pet peeves with the MS-DOS community in general ...
everyone seems to have mostly stopped releasing source listings,
even for software clearly released to public domain. I hate
having to binary patch a comm program for my specific serial port
combination, just because it is slightly different from original
IBMPC. And forget about adding another function or two, or
changing the way something works, unless one is willing to invest
hours ofreverse engineering time.

>worthy waste of time <g>.
>Rick[A

I was thinking about this yesterday, and what approach I might
take in implementing something like this. What would be really
nice would be logical bit mapping in such a way that commonly used
software (for example, a RAM disk driver) would see the same pages
in each mode in logically the same positions. Then one could run
in XL mode, hit the reset and ROM switch to 800 mode, and the RAM
disk would still be accessible unaltered.

For whoever else might be trying to collect information on RAM
upgrades and such (I have a mostly stock collection of Atari stuff
at present ... but soon to change), be aware that there are two
Buchwold mods that I am aware of ... the first was the 32K banked
version that I _think_ may be what is commonly called the Buchwold
mod, and a second 16K banked version which is quite similar to the
more common XL mods.

I will try real hard to clearly write up more or less fresh any
mods I do, post them for comments, and if it seems passible enough
posted to umich. Probably the common 256K addition to the 800XL
will come first, though I really would rather add 512K, but want to
put the sheet metal back intact when done.

>to hear from other who have succeeded.
>

There have been some discussions here about this, and the jist of
what I have gotten from them is that there would be no problem
upgrading the clock on the 6502, but that the display controller,
CTIA/GTIA also runs at the same speed, and accesses the same
memory, and is inherently clocked at the stock frequency to
generate NTSC or PAL. It would be a major design effort to figure
a way for these two processors to coexist at different clock
frequencies, effort that is generally regarded as better spent on
including a 16 bit processor in place of the 6502 ... hence the
Fine Tooned Engineering Mars8 board, soon to come. I think that
is a general summary of the situation.

Bear in mind the '138 decoder could be used to replace some logic,
if timing considerations are taken into account carefully. Also,
though I would hate to design this into a commercial product, I
have often done decoding with old fashioned diode OR or AND gates
... particularly in conjunction with CMOS gates due to their
higher input impedence. A GE diode (say 1N270) (or more modern
.. a Schottky type) could be used to minimize voltage drop and
increase noise margin. Or a magnitude comparator (designed for
such uses) such as 93S46 or 93S47. I would tend towards a diode
AND feeding a '138, if it was fast enough.

>That was the main reason for me to conclude that 6502 is more efficient.
>

Well ... depending on what you call the processor clock. The 6809
uses _exactly_ the same type of memory timing and access as the
6502 and 6800 ... A 2 MHz 6809 can run at an E rate of 2 MHz,
the same as a phi2 clock of 2 MHz on 6800/6502. I suppose in the
Intel world they might refer to a 2 MHz 6809 as an 8 MHz
processor, since the XTAL frequency is 8 MHz, but in the Motorola
world they refer to it as a 2 MHz processor.

Point being, of course, that one must compare memory cyccle times,
which I think we agree on. The rest is probably just specsmanship
games of marketing types (gee -- this IBM PC runs at 4.7 MHz,
while that SWTP 6809 only runs at 2 MHz .. of course, the 2 MHz
6809 accesses memory almost twice as quickly as the IBM PC).

Hate to respond to myself, but actually in these days of
pipe-lined execution and high speed caches any comparison of
instruction execution times (which is basically what we are
getting at here) is getting more and more complicated where
systems design can be as important as processor details .. for
complex processor types, perhaps only benchmark performance can be
compared ... which is another can of worms.

And the original (or far back anyways) post on this was basically
saying that simpler instruction executions (less cycles per
instruction completion) make the 6502 faster than it might
otherwise appear in comparison to the 6809. Actual performance
would depend on the overall task complexity.

1132. Atari 8 Bit Sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-06 17:29:07 UTC
From: aj445@cleveland.Freenet.Edu
Message-ID: <3h5m93$j05@usenet.INS.CWRU.Edu>
Source record: 94670

I have the following Atari 8 Bit items for sale to the highest offer. I would naturally prefer that the interested parties be within driving distance, so that they could actually SEE and operate any system that they are interested in (I'm in N.E. Ohio). However, I realize that that would be severely limiting the pool of prospective buyers. Be assured that all items are in perfect working order. All memory upgrades were done by myself, as well as any mods and normal maintenance.

Atari 600xl (64k)
Atari XEGS (128k)
Atari 800 (48k)
Atari 800 (188k)
Atari 1200xl (1 meg ... this one will be hard to pry from my fingers!)
Indus GT disk drive
Percom SS/DD disk drive
Atari 810 disk drive (Happy enhanced)
ICD PR:Connection (new)
Avatex 1200 baud modem
Basic XL cart.

(the above items all include power supplies)

The following system will ONLY be sold AS A SYSTEM!

Atari 130xe (320k)
ICD MIO (1meg)
30meg SCSI HD (two 13.5meg partitions)
Basic XE cart.
2400 baud modem
Commodore 1802 monitor (NOT perfect; occsionally needs to warm up)

I will personally check out any item prior to shipment. I'm a Sr. Electronic technician, and hold an Extra Class FCC Amateur Radio license. These items were well cared for. As mentioned, I'd prefer a local buyer, but I will ship to continental U.S. locales. If you are SERIOUSLY interested in any item, you may contact me at:

aj445@po.cwru.edu
cooncat@ix.netcom.com
kb8eb@wa8bxn.#neoh.oh.usa.na (packet radio)

Bill Somrak
(NOT leaving the Atari 8 bit community for good. I'll ALWAYS keep at least one system up and running, for old times sake!)

|> > to have someone check 'em out, and maybe clean, align, and replace the belts.

Try using MyDOS 4.5, or Sparta 3.2g, both are available PD, likely from
the Umich archive. If the drives continue to lose data, especially with
MyDOS, you'll have to have them looked at. Bob Puff at CSS is probably
your best bet. Bob Woolley of the San Leandro (CA) Computer Club can
probably also help you. If you have a local club with 8-bit members,
appeal to the hardware guru amongst them.

|> > 2) My only memory-modified machine died; probably a bad ROM. Need it fixed.

Get some spare parts of the LSI IC's, from either a garage sale system,
or mail order from ATV for $7.50. Try swapping out the ICs (assuming yours
are all socketed). One of the Bobs can help you here.

|> > 3) My 130XE cart. slot doesn't work - like to have it fixed, and perhaps
|> > the memory upgraded.

I'd suspect a loose solder joint, or copper lands de-laminating from the
board due to mechanical stress. Seek out a generic electronic repair guy,
or one of the Bobs.

Memory upgrade: of course check out the vendor's lists. Once again Bob
Puff may be the best choice if you don't want to install it yourself.
Installing one is maybe a two-hour operation, with good instructions.

|> > 4) I'd like memory upgrades on some of my other machines.

see above

|> > 5) I'd like **someone** to help me get a hard drive working....I don't
|> > know what I need to get one going on the BB, and I don't know what
|> > software/formatters I need to run, once I get the cables plugged in.

Bob Puff is the best person to answer this one. Bob Woolley can help,
as I have read he has done this for 1200XLs.

|> > 6) I'd like to get those neat Video/Audio upgrades done, on at least ONE
|> > of the machines. Has anyone ever done the stero sound thing (Gumby?)

I've done the Video and Audio upgrades from Atari Classics mag, but not
the Gumby. Micro Discount (Great Britain) sells an easier-to-do-it-yourself
stereo sound thing.

|> > PS- WHY DOESN'T ANYONE EVER REPLY TO MY POSTS? HAS MY DEODERANT
|> > FAILED ME???? :)

Maybe it's your sparkling personality that leaves us in awe....

continuing (and censoring):

|> 1) Out of several machines, the best ones (130XE, 256K 800XL) have problems.

Well, if you're of the type, you can swap the big LSI devices between
machines. Just don't do it in a high static electricity atmosphere.

|> 2) My floppy drives are getting old and in need of a tune up

Try the normal head cleaning with isopropyl alcohol and a swab, and a light
lubricant on the stepper motors. Check with Best for new belts, if your
need them. Don't ever get lubricant on either the head or the belts.

|> 3) My disk media is all getting old and important titles should be backed-up
|> if I could find disks.

I find DSDD 5.25" at stores like Target and Office Depot fairly regularly
for $4 a box (of 10). Admittedly they are getting harder to find.

|> 4) Don't know where/who to get upgrades/repairs from (audio, memory)

see above.

|> 5) Nobody volunteers any information

well, here you go.

Ahhh ... an opening for my slant on this problem/question. First
off, my impression is that you have not mixed the types, and found
one more reliable than the other .. you are just having
reliability problems with the ATR.

I don't have my ATR up as yet, but knowing that it was CP/M based
made me think that the answer to your problem might lie in track
or sector buffering, particularly in relation to directory sectors
and such. It is possible the ATR8000 may have buffered writing,
and the floppy could be removed before all the information was
written to it. This can cause some really weird problems
(speaking as one who puts up with an IBMPC that often doesn't know
the disk was changed due to defective hardware probably associated
with the disk_changed signal, which is not on every floppy drive
anyways) even when just reading disks, and can easily scribble the
contents when writing. Track buffering started to become really
popular with CP/M systems just before their demise as a means of
speeding up floppysystems given the then high cost of hard
drives.

It is also possible that the ATR8000 may not implement the motor
control line, and may spin the drive continuously, perhaps even
with the head loaded if the drive is selected. Does the light on
the drive stay lit continuously?

There is no inherent reason that a high density disk in a high
density drive should be any more or less reliable than a low
density disk in the same drive, other than the naturally greater
data density. A low density disk in a 1.2 meg high density drive
or a 1.44 meg 3.5 inch drive should be just as reliable as the
same disk in an 80 track 5 inch mechanism (low density) or a 720 K

3.5 inch drive with the same disk.

>

Something else that occured to me, at least that I would check, is
that the drive and/or ATR8000 does not have a marginal power
supply. Particularly the drive supply, if the inputs to the
voltage regulators for the drive dropped under the load of track
switching or startup. Check for excessive AC ripple coming into
the regulators, with a 'scope if you can. Just something else to
try.

Sometimes I hatethe way my mind jumps around problems.

Another thing which is unliely, given what I presume is your
general competance level, but has even bitten me at least once,
and took two weeks before I found out. Make sure the drive
terminator is installed or enabled. I once ruined three system
disks on my 6800 system due to removing inadvertantly the drive
that had the terminator, and running the drive unterminated. I
surmised that the problem was noise coupling into the write_enable
line on the floppy cable, perhasps from the read_data line. You
won't see this kind of thing in the IBMPC world (least not often)
as the cables are typically 18 inches or less, but I was running
about 3 or 4 feet of cable, and the terminators were DEFINTELY
required. One of the reasons why I have since been almost
paranoid about using write protect tabs where approriate. Also
one of the reasons why I HATE any copy protection scheme, and
always install software from copies if at all possible.

It has been a while since I programmed my Ataris in anything other than Basic, but I did do a series of articles on which languages were available for the 8 bit Atari. I do not know the availability or the current cost of any of these.

Languages available:

1. Assembler - several sources (6502)
2. Basic - interperted and compiled (several sources)
3. Action! - compiled structured 8 bit only language like C
4. C - several sources most based on Palo Alto Tiny C
5. Pilot - Atari Cartridge, not good for much but computer aided instruction
6. Logo - Atari Cartridge, good for kid's first language
7. Pascal - a couple of sources, hard to find, not good editors, enviroments
8. Forth - several sources, Fast, hard to learn
9. Lisp - one source (Antic program exchange) Slow

Like most programmers on the Atari I think the best bet is to use Action! It is fast, and it was made to run on this machine.

This may be of interest to those of you who have PC's with CD drives
(no-one has actually got a CD on their 8bit have they :-)

I'm re-doing the Mega-Archive CD so that it has support for the 8bit
atari. Basically the a.a.u.e 8bit directory will be there in all its
glory. Anyone who wants to know more should read my home page - I
reckon this is pushing it far enough as regards advertising :-)

On a serious note - if anyone knows of any stuff in the 8bit directory
that is porn or copyright, please please tell me. The original CD had
some transcripts from alt.sex.stories (in the Demos dir) which slipped
past me, so it had to be recalled in the UK. Expensive. Not something
I would want to happen again.

ATB,
Simon.

(who still reckons Lucasfilm' Ballblazer is the BEST)

Ok as i babbled before im new to the atari Scene. So i dont
really know what all the files on archive umich edu are. Basically i see
just a bunch of names, and the 0index doesent have the file descriptions.

Ok this much i gleamed form the newgroups, the CC65 id the C
programming lang/compiler for the atari 8bit. But before i go and try to
download all the files in the cc65 dir on umich with my dinky 1200 baud
modem, can anyone just tell me what files i essintaly need for starting
out with this? thanks...

also anyone have a master file list with descriptions they can
mail to me about umich.edu? <just for the 8bit section>

Thanks folks, you people here are really getting me to enjoy my
8bit. :)

Sine we're bashing the MS-DOs community, I'll join in. :)

I agree that the distributin of source code is a big problem...
I don't know how many times I have downloaded a file that is just
about ALMOST perfect for my uses. It turns out to be shareware. Ok,
cool. I try to contact the author, but since it is an old file (1 whole
year or more, usually), the author has usually moved and left no
trace -- no CI$ address, no I-net address, or it has one or the other,
but neither are valid anymore. No forwarding address at the snail
mail address listed in the documentation.
And, invariably, this shareware which is obviusly no longer
supported, and the author is no longer making money from it, does not
include source code, and the source code is not available under
seperate cover (another file).
The moral of the story: No matter what platform you are
doing your work on, whenever you decide to stop supporting your
shareware program, release the darned source code! :)
This is what I plan to do whenever enthusiasm for my BBS
"door" game drops off....then someone else can pick it up and do
whatever they want with it, and thereby benefit from it. Why not?

-Joe

Gee Richard, I don't know how far I'll get into this. Remember I'm an advocate of the 74LS688 8 bit comparitor just so I don't have to think<g>. I've got about a dozen of those puppies laying around in my parts drawer just so I don't have to do any thing other then plug a HEX number in my calculator & hit the 'BIN' key! I am in a screw around with memory mode right now though so inertia may carry me through to the point where I'll at least get back with why I think it didn't work.
Somehow I've assembled a huge supply of 8k CMOS SRAMs, must have 20 or so. I'm thinking of doing this leap frog thing. The latch in cart thing I sent out had a 74LS138 in it so I could divide the !$D500 line into 8 pieces each starting on a $20 multilple. That's why I needed the info someone supplied about the Super Carts=> what can be mine & what was already taken. It all gets confusing because of my unusual <for me> brevity, but you can figure out where I'd like to head if I tell you the latch was part of a modified circuit from a 6809/6845 display with transparent memory access by phase 1 & phase 2 (or was that zero & two??) interleaving of the memory access to the ram. The Axlon thing is while I'm resting. I also thought the vapor ware products by Canoe<sp?> were interesting even if no one purchased a single one. It may be next on my hit list, 8k battery backed up CMOS RAM in a cart. Why? No reason at all. I can't even concieve why someone would want one, but it would take me to the next step.
Rick

From the Ramdisk 128 Memory System User Manual;
You can place one of eight 16k memory segments at address $4000-$7FFF.
Segment selection is controlled by writing a segment number to ANY address
in the range)0FC0-0FFF OR $CFC0-$CFFF. The last 3 bits of ANY data wriiten
to these addresses selects the segment.

What is the difference between

Atari User
Atari Age
Atari Connection.

I think the latter is what you used to get free subscriptions too when you purchased an 8bit.

The first? Is that that thin news paper print mag?

Up front, I know the lines, but I've never been into the XL/XE OS so I'm bound to be off on my interpretation. M(ath) P(ack) D(isable) is just a line that tells the smarts in the computer to disable the FP ROM region <$D800-$DFFF> & map the ROM on whatevers hooked on the PBI into that region. Sort of like the way the self test mode is implemented. I don't have an XE schematic so I can't even tell if you have to be able to toggle it to re enable the FP ROM or what. But if you do figure out how to get a PBI ROM to run from there, I'd sure like to know.

Pulling out my old grandaddy on serial _stuff_, the NBS Technical
Guide to Computer-Communications Interface Standards, and perusing
it for tidbits ....

what follows is longish, if you want to skip trivia.

------

the document refers to ISO R646, which led to ANSI X3.4 which is
also known as the American Standard Code for Information Exchange
(ASCII), and with the clear proviso that the code is constantly
being revised, and this document refers to ASCII-68, the current
version when it was printed in 1974. Also refers to the federal
FIPS-1 standard, which specifically interprets line feed somewhat
differently.

serial by bit, low order bit first. even parity, seven bits for
async, odd parity and seven bits for synch.

on to characters. the 32 ASCII control characters are divided
into communication controls, information separators, format
effectors, device controls, code extension controls, and other
controls (gee whiz, they always leave an out, don't they)

communication controls ... ten characters .. SOH, STX, ETX, EOT,
ENQ, ACK, DLE, NAK, SYN, ETB. designed to control or facilitate
transmission of information over communication links. more to
follow.

information separators ... five characters, File separator (FS),
Group separator (GS), Record separator (RS), and Unit separator
(US). The space character (SP) is also considered part of this
group, and they are placed so as to be contiguous with the space
character (hex 20).

format effectors ... six characters ... BS, HT, LF, VT, FF, CR.
these control the layout or positioning of information in printing

and display devices. they can be further split into horizontal (BS, HT, and CR) and verticle (LF, VT, FF). often a source of problems in terminal compatibility, so discussed further ....

BS ... "controls movement of the printing position one printing space backward on the same printing line (applicable also to display devices)" the definition is written regarding printing devices, and thus overprinting is implied. the specific usage is in the expansion to ISO standards, where such things as diacritical marks may require usage of the BS, and is indeed specifically mentioned in ISO R646. [note that almost no video terminal acts this way .. rbd]

HT .. horizontal tabulation "controls the motion of the printing position to the next of a predetermined of a series of positions along the same line" no provision is made for setting or clearing these tab stops though.

CR .. "controls the motion of the printing position to the first prinitng position on the same printing line"

LF .. "controls the motion of the prinitng position to the next prinitng line" note that specific horizontal position is not specified. however it goes on "where approriate, this character may have the meaning 'New Line' (NL), moving the prinintg position to the first prinitng position on the next line. this requires agreement between sneder and receiver" the federal standard specifically omits this portion. a proposed (as of 1974) revision would assign NL as primary usage,here, and LF as secondary.

VT ... vertical tab .. "movement of the printing position to the next in a series of predetermined printing positions". as in LF, no specific mention of horizontal postion but often taken as meaning dfirst position on that line, as in NL.

FF ... form feed ... "controls the motion of the printing position to the first predetermined printing line on the next form or page". again, horizontal positon not specified, but purposed as first position in the revision.

and on.

Device controls ... DC1 (XON or reader on), DC2 (TAPE or punch on), DC3 (X-OFF or reader off), DC4 (barTAPE or punch off). defato standards for the mentioned functions. [and as we all know, XON/XOFF is used for flow control frequently .. rbd]

Code Extension controls ... SI, SO, and ESC.

Other controls ... NUL, BEL, CAN, EM, SUB, DEL (strictly speaking, DEL is not considered a control character).

NUL is used to
accomplish media fill or time fill. it can be inserted or removed

without changing information content, but it may affect layout or control of equipment.

BEL ... call for attention. it may control alarm or attention devices.

CAN ... cancel .. the data it accompanies is in error. specific usage must be defined for the application.

EM .. .end of medium. may be used to indicate physical end, or the end of the wanted portion of data.

SUB ... substitute ... a character that may be substituted for one known to be in error or invalid. the exact usage is undefined.

DEL .. delete .. intended to erase or obliterate and erroneous or unwanted character in punched tape by overpunching. current standards have this functioning quite similar to the NUL ie time fill.

graphical representations are also specified for all these charaters.

escape sequences for code extension .. rules .. control characters and DEL are illegal in escape sequences. column 2 is considered intermediate characters (puncuation .. SP thru /) the rest are final characters, separated into groups for private and stndardized usage and some dicussion of specific sequences.

Now, the communication control characters ... messages may be split into block, and may be further split into headers and texts. Every block begings with a SOH if there is a header, or and STX otherwise. blocks other than the last (in a multiblock message) are terminated by an ETB. the last block of a message (including a one block message) is terminated with ETX. this gives a flavor of the usage of thes e characters, with the following meanings:

SOH .. start of heading
STX .. start of text
ETX .. end of text
EOT .. end of transmission
ETB .. end of block
ENQ .. enquire (request for response) [which response could be refered to as the answerback string in ancient TTY33 .. rbd]
ACK .. positive acknowledge
NAK .. negative acknowledge
SYN .. synchronous idle
DLE .. data link escape

---

there .. more than most anyone wants to know, but less than there is to know (like everything). I included all this because it may interest some to see where the usages of some of these specific

characters derived from. I am not so old that I ever worked on model 33 Teletypes (though one might think so from the age of this material), though I did have to punch and load tapes on those mechanical beasts when I was a newby tech. I was smart enough to yell for help when they broke! Anyone who has looked at the Xmodem protocol may have some insight into why they chose some of the control characters they did (was that Ward Christanson?? ... wow, one of the first BBSes ever).

Would it be feasible to wire up something like this on a PBI experimenters' board? With 2 bytes on the PIA for address selection, that's 65536 pages available, or 16megs... sounds like an acceptable RAMdisk, for an 8-bit. Added bonus of using the PBI: more real estate than inside the case. Plus, independant power supply.

And, for the really sick individual, combine it with the Newell 4meg internal and have 20megs.

The mind reels.

Dave

1166. FTe plans to debut MIO II at Toronto Show

Newsgroup: comp.sys.atari.8bit

From: F Tooned <ftooned@delphi.com>
Message-ID: <ZW9YjW1.ftooned@delphi.com>
Source record: 94606

Hi everyone,

I've locked the MIO II into it's final design stage, and figured
that I couldn't pass up introducing it on April Fools Day!!

There were 12 advance orders, (6 in Canada) (1 in the UK) (and 5 in the US),
and although I plan on delivering the Canadian units in person, I will
get the other 6 in the mail as soon as they are finished. (mid-March)

I will also be attending the Sacramento show towards the end of April
if there are any 8-Bitters that might be thinking about going to
either show...

Thanks to everyone for their support and patience, as I couldn't have
done this without you.

Mike

1167. Contacting Monitor magazine?

As far as being a new standard for banking memory, I'd sort'a expect
a number of people to make comments like, "Who died & made you engineer?"
if I proposed such a thing. As far as the capabilities of the thing
go, 8 bits of bank latch give you about 4 megs of banked ram. Things
that people do now to expand memory, like eliminate built in BASIC, would
be a thing of the past. *BUT* I've also heard people say they prefer to
use a BASIC cart over built in BASIC anyway so no big loss. I guess I'm
saying the way people seem to work around here is ask for backwards
compatibility as well as forwards. But we have run out of free pins on
the PIA chip haven't we???<grin!> I'm of the mood the Axlon scheme was
OK & supported expansion out to 4 megs. A latch is a latch, I don't
care where I put it so $CFC0-$CFFF is fine, $D380 is fine also. Remember
last time we had this conversation here about the Mars Board, snide remarks
like, "What? Another RAM disk!" were tossed around with what seemed like
1/4 the group saying a ram disk is just what I want, 1/4 saying only if
it has an application written for it, 1/4 saying what about compatibility,
& the last 1/4 saying I couldn't afford a 4 meg simm let alone the cost
of the upgrade. Let's face it, we're a tough audience. IM<not so>HO:
matter of fact, if I ruled the world for a day, my first edict would be
all 8 bits will be 130XE compatible & from here on out, all memory upgrades
for expansion will use the Axlon standard for memory beyond 128k. Or
maybe just the Axlon part for people who prefer 4 joysticks. Unless
I'm willing to develop the circuit to convert RAMBO type upgrades to
Axlon compatibility though, it's a mute point. It does seem to make a lot
of sense, but you're still asking people who like their computer just as
is to make a hack.
Rick

: I am real. Dead? hmm...depends on your definition.

Well, i hope. I meant that nobody produces ATRI 8bit (almost nobody).

1171. Re: SIO commands etc.

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-07 15:57:24 UTC
From: CONRADUS%PLEARN.BITNET@PLEARN.EDU.PL
Message-ID: <199502071556.JAA08593@mail.cs.utexas.edu>
Source record: 94612

Hello.

>Could someone please tell me all of the commands (and what they mean) that
>are sent from the 8bit to diskdrives/printers/etc. ?

There are two important things: the Device Control Block ($0300-$030A)
and SIO-entry (JSIOINT $E459). If You don't know, how to use it, please
ask me.

Standard commands:

ASCII

! format disk (drives only) in configuration, that has been set.
" format disk in medium density (drives only)
? get AUDF (US Doubler-compatible drives only)
N read configuration (drives only)
O set configuration (drives only)
P put data block/sector (no verify)
R read data block/sector
S read status block
W write data block/sector (same as 'P', but with verify in drives)
X send/execute program (Indus GT/LDW 2000 Super/CA-2001 and compatible)

The DCB should be set as follows:

DDEVIC ($0300) - device-code:
$31 - disk drive ($31, this isn't a mistake!)
$40 - printer
$50 - RS-232
$60 - cassette recorder

DUNIT ($0301) - unit number (eg. 1 for D1:)
DCMND ($0302) - command specified above.
DSTATS ($303) - before operation this should contain $40 for reading or
$80 for writing. After operation contain status code:
1 - success
>128 - error

DBUFA ($0304) - data-buffer address, eg. 256 bytes for sector to be read
or data to be written to disk, printer etc.(WORD!)
DTIMLO ($306) - timeout-value. Don't touch.
DUNUSE ($307) - reserved, not used.
DBYT ($0308) - record length. For disk comms. are 128, 128, 256, 12 or 4
bytes for single-density sector, any formatting, double
density sector, set/get configuration or status, respectively.
Printer-record has always 40 bytes. (WORD!)

DAUX1/2 ($30A) - number of logical sector on the disk.

If You set all the DCB-values, your program should call the JSIOINT by JSR.
Hope it helps. If you go in any troubles, please ask me, perhaps are any
mistakes above (I am using my memory only now).

Konrad Kokoszkiewicz
conradus@plearn.bitnet

PS. Sorry for my bad English.

>When is it by the way?
>

I have not seen a specific reference to this years event as yet,
but I am working under the assumption that it is the 22nd and 23rd
of April this year, as I seeem to think it is always the first
weekend after Easter.

If you were there last year, and filled out the ticket stub for
the door prizes with your address, you should get a flyer sometime
in March from them with directions and schedules for this year's
event. Though last year that came fairly late, as I recall,
perhaps only two weeks before.

>people who insist on pirating software. I just hope the law catches up
>with those responsible.

Shouldn't we perhaps distinguish between two issues here? I have every
respect for someone like Richard Gore still struggling to sell software
for a virtually dead computer, but I think "classic" Atari games are an
entirely different thing. The classics are abandoned software, noone
sells them, no author gets any profit for them, the authors and publishers
don't care for them, so why the heck should it be immoral to make these
games available for FTP?

I use that in my PCs ... one of the problems (certainly solvable)
with using them out of the box in another system is that they use
the IBMPC type drive addressing ... where the twisted cable cause
the drive select and motor control lines to swap. I would presume
that getting drive 0 to respond would take some rearranging of
jumpers or perhaps even trace cutting and rearranging.

Syquest drives, with removable media in cartridges. The 5 meg
versions are pretty straightforward, and the ones I have played
with work at RLL for 8 megs or so, but the 10 meg version requires
a slightly special controller, one that knows about an added line
(I think a media change line or drive ready line). They WILL NOT
work with standard IBM PC type controllers. The Adaptec 4000A and
4070A commonly used with Atari setups such as the black box will
work with the 10 meg drive if jumper configured for that line. I
have no reason to think that the 10 meg version won't work as well
as the 5 meg version on RLL, giving 16 megs. The 5 meg version
does not like the extra dense ARRL controllers like the Perstor
which give about 190-195 percent more space rather than RLLs 150
percent. I have never used the 10 meg version as yet, so I don't
know it will work at RLL though.

<grin> The water soaked crates at Trenton I bought .. picked up 8 Syquest 5 meg drives for $10 at the end of the day, two of them worked out of the box, a third works but doesn't interchange with other mechanisms.

As a disclaimer .. don't ever open a Syquest cartridge up outside of a clean room environment unless you want to court disaster. But ... this is what I do personally. Your mileage may vary.

If you buy used cartridges, be extremely careful to not wipe out the heads with a ruined cartrdidge. I know you are not supposed to open them, but I do, in a nice quiet as dust free as home gets room, and slowly turn the media inspecting it under a bright light. Then I try it out in the drive that won't interchange with the others, I figure that way a crashed head won't bother me too much. Head crashes on these thing tend to migrate to multiple drives and multiple wiped out cartridges as operators may start blindly moving things around to see if they can find a combination that works. At work, we had someone from another plant come in an wipe out a 10 meg Syquest ... "these cartridges I can't get to work at home, maybe they'll work here" And the 10 meg drives have better lights to tell you when to remove cartridges safely. The 5 megs you want to be sure it is spun down before removing the cartridge completely. The key is to remember that they are not floppies ... I even try to wait five minutes or so after inserting and spinning up a cartridge before write accessing it, as I have occasionally had various temperature related intermittant misreads on various MFM and RLL drives, and like to keep temperatures constant when I can.

My Mac/65 is nothing but disk; the original disk-based version. I think that there is a MAC/65 utilities disk, with a lot of macros etc. I beleive floating point math was on that disk as well.

Hello !!!

Yes, your right a little bit. MPD allows to switch off the internal ROM from $d800- $dfff. But now you have to do something something other - you must also disable the internal RAM from $d800 - $dfff.(extensel)
The best solution is using a GAL, a FlipFlop and a 2k Static RAM to get the PBI tested .
The GAL is for decoding the adresses and generating the ChipSelect signals for FlipFlop and RAM.
The FlipFlop you have to place at $d1ff. With each bit you can switch on one PBD. So use the FlipFlop to hold one DATA-line.
If these is switched on, the GAL have to deaktive the ROM and RAM if an adress from $d800- $dfff is used and aktive the Static ram on the board.
Then you have to put a special header into the RAM (a quite normal handlertable as E: or S:), a jump to the SIO routine, and some bytes to identify the PBD (so that the OS knows that there is one).
Now your able to look at every SIO-Operation and could change the drives ...

A friend of mine has built some PBD and I love to use it!!!

Matt

I've never used it but it is a version of C that you need MAC/65. When
someone did a review of Lightspeed C (I believed it was called) they
mentioned both C/65 and Deep Blue C. As I recall the reviewer said that
both sucked hot rocks, were slow and pretty non-standard. I guess
Lightspeed
was head and shoulders above them.

> Rick

Now I know what it does, it's pretty simple :), if you take the line to
GND, it just disables the internal mapping of the ROM from $D800-$DFFF,
if you let it go high again, the ROM comes back.

The schematic doesn't help a lot - the wire from MPD/ just disappears into
a PAL - did Atari ever release the equations for the PLDs in those machines?

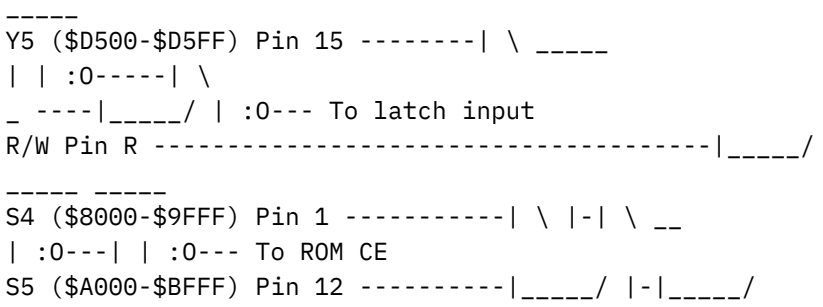
The super carts that I've seen just take the $D500-$D5FF decode line,
gate it with R/W and feed this to the LE pin on the '374.

The selected 16K page then appears between $8000 and $BFFF.



Apols. for the nasty ASCII schematic.

From: Peter@bell.demon.co.uk
Message-ID: <792186090snz@bell.demon.co.uk>
Source record: 94623

Another stupid question, can anybody tell me precisely what the effect on the memory mapping is when you turn on the 'enable diagnostic ROM' bit on PB7.

I've just discovered (after about 1 1/2 years!) that if you type 'BYE' on my modified 800 the system crashes :(. The ROM image looks OK, so I think the decode logic must be confused.

Was there ever an 'offical' set of schematics for this drive?

I've got a set, but they look hand drawn up and about 4th generation
photocopies - you can't read any of the pin numbers.

Also, is the piggyback board standard fitment, I thought that the 1771
just plugged into the main PCB, but it seems to be on a seperate card
with some MSI chips in this one. Anyone know what this board does
(it looks like original Atari).

Artem Koutchine (koutchin@mail2.sas.upenn.edu) wrote:
: : Yeah...thats intelligent...be against retailers. DUH.

: Did I say that ? I said we shouldn't pay fo anything that should be free.

Again "should" is based on opinion. I think ALL SOFTWARE in the world
for any system should be free! Then only the good ones would get used...
(yes, because those people who enjoy programming would do it...
and those who are only out to make a buck would DIE.)

Look at it from a collector's point of view. I collect tons of
Atari equipment and programs. If I can find a MINT 5200 game with
box,dox, and cart..etc... I'll pay up to $10 for it. Apply that
reasoning to the 8bit stuff. Out there on store shelves lie mint
copies of such greats as AR! Still shrinkwrapped. I own both the
Dungeon and the City. I own pirated copies of both as well since
I don't enjoy using my copy protected master disk. However, I
will PAY the $6-$12 for the software, box, and stuff rather than
just get a pirated copy.

In fact, My first copy of AR-City was pirated. I played that forever.
And when I heard the Dungeon was coming out I put out the then $35 for it!
And as recently as last year I purchased a copy of the City for $12 because
I wanted everything that came with it! And I might be purchasing more
products of programs I already have that are pirated. Simply because the
PRICE IS RIGHT and it warants it.

I don't mind the idea of everything being free! That would be great..
then I might be able to actually get %90 of everything ever made for these
great machines. But to say "it should be free" is very strange in my thinking.
As well are the people who said we atari users must be nuts or rich to purchase
such things. I wonder how many of them didn't purchase their MSDOZE or WINTEL
or Mac software. I can see where it would be BETTER to pirate all that crap
(cause it is junk) since its so damn expensive for such horrible coded stuff!

Honestly, I'd spend $50 sooner on buying Atari software from a retailer
before I would even consider purchasing anything for the other systems.

Of course, that's just me.... =)

Andrew.

Rick_Michael_Cortese@cup.portal.com wrote:

[A lot of great info!]

Well, 4 meg SIMMS are a bit expensive. However, 1 megers aren't...and neither
(and whomever said they had the notes for hooking up a 1meg simm please find
them!)
are 256k ones. I imagine all computer should be 130XE compatible for the
first 128K then upwards it should be Axlon. I also imagine a little
M-box the slaps onto the PBI and has nothing but simm sockets. =)
Of course, if some people designed things according to specs..that is...
PBI devices should not take entire control of it and use up all the
handlers! then adding a stack of devices out the rear of an XL would
be childs play. I am still curious why no-one has ever redesigned
the 1090 concept. MIO's and BB's are great and have literally kept the
8bit alive... but sometimes I wonder if people were thinking of the future.

Heck, it would be great to plug in a network card to the PBI...or a memory
device... except you lose everything else on the line since nothing is
compatible with it.

Heck, all systems should have 2 pokeys and 2 pias at least! The R-verter
circuit is so simple it can be simplified even more.. and you can mount
the thing right inside your Atari. And a printer port can fit nicely as well.
(Speaking of which..anybody got the notes on doing such a hack? I have
a free pokey sitting here... and I can always slap on another PIA from the
P1050 project) (I also have some APE device that converts the SIO to
printer... but the darn thing looks like a pirated copy and always flaked
out on me.) Hmm..yeah... oh yeah!!! A 1200xl with RS232, Printer,
floppy... ahh... fun fun. (How big is that MIO2 going to be? heheh)

Does anybody know if the MIO2 came about because someone had an IDE drive
in their 1200xl? ;) And does anybody have 1200XL's they want to sell me?
Anybody have boxes for their atari equipment they want to sell/give me?

How long IS a piece of string?

umm..er... (calm down calm down...)

Well, I think if you could do a 1Meg battery-backed CMOS RAM in a cart,
in 64K banks or so, that would be really nice for rather fast loading,
of all sorts of stuff. Perhaps if you put a keypad on it, then that could
be decoded into which bank you wanted - removing any need for it to be
software driven, and all the hassle that goes with that.

Does this make sense? It was just a quick idea...

Richard =8-]

PS. Are there many people out there that use an ST aswell as an 8bit?

heller@akh104.rh.psu.edu (Andrew K. Heller) writes:

>What is the difference between

> Atari User

AtariUser (one word) was the California-based comic book style magazine covering all Atari platforms in the early 90's. It was free to user groups for their members, and designed to derive it's income solely from advertising.

The UK has New Atari User, still published by Page 6 Publishing. That implies to me that there used to be an Atari User magazine in the UK, but I'm not familiar with the history there.

> Atari Age

This was the Atari-produced magazine for video-game players. In the early 80's, it was mostly part of the 2600 heyday, but they also did some arcade, 5200, and a little bit of 8-bit computer coverage.

> Atari Connection.

Also Atari-produced, this was their magazine for Atari computer users in the early 80's. Was later renamed Atari Explorer when they hired David H. Ahl. Very early on, you're right, you got a free year (4 issue) subscription to Atari Connection when you bought an Atari computer.

1198. Re: Piracy and FTP sites.

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-07 23:21:47 UTC
From: koutchin@mail2.sas.upenn.edu
Message-ID: <3h8vab$6kk@netnews.upenn.edu>
Source record: 94635

Hi Dave !

This is really nice to meet a person who thinks the same way that you do.
YOu are the second person except me so far. I am that nasty Artem who
"appears to have a very narrow minded view of how he wants things to
be with complete disregard to what the law says is legal."
Hope that this citation is not a violation of copyright :-)

What you said is exactly that i am trying to say last month but
nobody listnes. And i am afraid that nobody will listen to you.
Therefore i basicaly mooved to ZX SPECTRUM platform but
i bought ATARI 130XE though and going to get all soft i want from
Russia by email. Yes , yes. From russia. *bit stuf still very very
popular there and many people doing profit on it BUT ! They do
not mind that others making copies from any soft and distribute it
for free. Vendors just sell best-of-best soft in nice boxes and
people like to buy it. For example if have a really great game
with complex levels and control you'd prefer to buy original but
if you smart enough to play w/o docs you just take from your
friend or from that VENDOR (i am NOT kidding) for free.
I noticed that C64 users are having problem now becuse
their ftp cite is closed (actually C64 soft is removed from the
cite) because they have somekind of copyright problems and now
they are just recieving permissions from different copmanies to
keep C64 soft on ftp. They will probably get that permission and
it will be lawfull and just great as it used to be. By the
way the problem was made not by any of companies wich created the
soft but , as i understand, administration or someone else who
is in charge there.

One more, Bill (we all know him) somehow replied to my posting
about BBS listing in comp.emu.misc but he didn't in here. Why ?

Artem (with narrow view, hahaha)

P.S. to all vendors: get real and start selling new soft or
switch to ibm or mac. Selling hardware is profitable and
usefull for everyone so you can continue ;-)

>games available for FTP?

Well, Dave, it isn't so much a morality question, but a legality
question. It is illegal to distribute copyrighted material without
the "express, written permission" of the copyright holder.
If a person does so, he or she is breaking the law.
Seems pretty simple to me. :) Do you want to break the law,
or not? :)

How much hardware can you sell, tho? One computer per person
every few years. How much software can you sell? Many titles per person
per year.
Your argument is like telling Gas Station owners to give away
their gasoline, because cars are useful and more profitable per unit.
Bad argument, Artem.
As for switching to IBM or Mac...only in my worst nightmares
would B&C, BEST, Toad, et al switch to either of those misbegotten
platforms. :)

Another that he did was Guns or Butter, a great economic/military
simulation. Economic simulation is a better term, since it is the
great economic question all nations must answer that gives the program
its title and theme.
Reading his portions of De Re Atari (esp. the interface design
stuff), it is readily apparent that the Mac environment suits him to
a "T". So, I wasn't surprised to find this program (and Balance of
Power) on the Mac, as well as Windows.

1203. 1200XL power upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 03:08:23 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3h9cj7$gk6@hearst.cac.psu.edu>
Source record: 94640

I am in need of some room inside my 1200XL. So I have been seriously considering gutting all the AC crap inside. Having looked over this mother board here I would think that it would be easy to just add a standard 5VDC XL jack/supply to this thing. And then I can remove that horrible death sink and the 10000uF cap. and that (I assume) bridge rectifier. Why on earth is that thing so big? Why are there regular diodes silk screened underneath it?

Anybody see any reasons why this gutting wouldnt work? I need room for a PBI, serial, parallel..etc....

also.. anybody want to send me an Electrolytic cap (axial) 220uF 16V in the mail for $0.32 =) Radio S#@t doesn't seem to have any locally, and I don't want to purchase that big bag of caps and then NOT find one I need.

Thanks for reading this waste of bandwidth.

HI PEOPLE ! This is me ! Artem who has "one-track mind".

I have to replies in here.

1) About selling hardware

one 130XE - 75$
one game - 5-10$
therefore -> one computer = 8-10 games !
Plus, drives break almost everyday !!!!!
Plus what about floppies ? (if they are chipper)
And still what about games in neat,color boxes. People would still buy
it.

2) About Uppen ADM.

GO AHEAD !!! I DON'T CARE !!! What can they do ? Shut me up ? NO.
Terminate my account ? I have two more. One at Lasalle university
and one through russian nets. Plus i will get one in delphi (I like
it a lot). SO, you man is just yellow. Run and tell your mama ....

The strange electronics you mention could be one of two things. Later 810's had improved analog electronics (the grass valley upgrade?) that had an extra analog rear board in it. I can't find the details at the moment, but I will look for them. It is also possible that you have an 810 with a Happy Enhancement installed, some installations had the chips piggybacked. This enhancement allowed FAST I/O and the ability to copy most copyprotected software, but you need their software to make it run.
By the way, I remember that Happy Computing was going to release a Tech manual on their enhancements with info on how to program the drives, some neat improvements, etc. Anyone ever come across one of these? I would be interested.

>PS. Are there many people out there that use an ST aswell as an 8bit?

I have a 2 meg 520ST as well as several 8-bits. Very different feel to the ST's, I much prefer the 8-bits. Just to get the ST up to a decent version of TOS, a HD (which is almost a must for these machines) and a useable desktop (Neodesk 4) and software to multi-task is prohibitivly expensive! Never saw a machine with a more crippled OS (TOS 1.0) than the ST. It has been revised so many times it staggers the imagination, and is mostly bug fixes (for the ST and STFM line.) . But it beats the hell out of Windoze!

I think BEST has the "official" Atari repair manual, which may include
schematics. Keep in mind, though, that I've never seen two of the same Atari
product that are the same inside... it seems like every so often they changed
designs.

I think that the self-test runs somewhere in the middle of memory, replacing
RAM. On an 800, though, it should go to MEMO PAD MODE - remember that? It's
why I got an Atari in the first place - I discovered the full screen editor and
was hooked. That, and Protector from Synapse.

Actually, your sysadmin at Upenn was VERY interested in software piracy..
he even wanted me to forward him copies of your messages.

Yes, he COULD and probably WOULD remove your access at Upenn *IF* I
forwarded your messages. Not sure if I will..

You know, if you discussed OTHER items, I probably wouldnt mind so
much, but the ONLY messages you seem to post revolve around
pirating the software that I've been paying for lately. Why should
I pay for the software that you're stealing? There are several
companies out there (Best, B&C, American Techna., etc..) that are
still trying to make a living off of this "soft".

Oh.. One other thing -- sure, you could get another internet mail
account, but what would stop me or somebody else from contacting
that system admin?? Delphi would most likely terminate your account
for piracy as well -- as they surely dont want to be caught up in
such an activity.

Just food for thought.

You can run, but you cant hide!

1217. Re: Where to buy new 8-bit floppy disks

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 12:49:47 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Be7bjPD.lmcclure@delphi.com>
Source record: 94563

In a message dated 2-3-95, Rob Funk said:

"I don't see why HD wouldn't work -- the only macroscopic
physical difference is the missing hub ring, and the
magnetic properties are better than DD."

High-density disks that follow the proper specifications have exactly TWICE the magnetic coercivity that double-density disks do (when speaking of 5.25" diskettes; with 3.5" media, the difference is only 20%). I have seen reports of people successfully writing to HD media with a standard DD drive, while for others, the results range down to absolute failure. Aside from the mathematics of the situation, this anecdotal evidence alone suggests using HD media on a DD drive is a risky proposition.

Even if DD media is no longer available locally to some, DD 5.25" disks are still available from mailorder suppliers found in any issue of Computer Shopper.

1218. CD ROM and more.

I remember hearing a few months back that a group of people somewhere in continental Europe (Holland, Germany or Poland perhaps) were working on CD ROM (interface) for use with the 8-bit Atari. I don't know how it is progressing though.

Atari User was a magazine published by Database Publications several years ago here in the UK, they were subsequently bought out by Page 6 and now a magazine New Atari User exists published by Page 6 publishing. Well when I say bought out I don't mean corporate take over or anything like that, basically Atari User was due to cease publishing and Page 6 wanted the name and the articles and 8-bit stock and so a deal was struck.
Just too add confusion I also think there was a completely separate Atari User published in the USA. As to Atari Connection and Atari Age, I've no idea.

1221. Term Prog for 800xl, Best way?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 15:29:41 UTC
From: jct@astro.ocis.temple.edu
Message-ID: <3hao15$hag@cronkite.ocis.temple.edu>
Source record: 94654

Hi. I just recently wipped out my 800xl and realized what a cool machine it is. I have an 800xl, a 1050 DD, an 850 serrial interface and a modem on "R1:". My only problem is, i have no term software. What i would like to know is, what would be the best way of going about getting term software that will work on my 800xl from my PC. i have been reading this group for a little bit, and have seen things such as SIO2PC (i don't really want to build a cable) and Mule (has anyone tried this?) but my ultimate question is what's the easiest way to get a decent term program to my 800xl? what would really be neat for me is a term program written in BASIC. i made a silly attempt at a BASIC term program last night, but i don't know anything about "Concurrent Mode" or how to get strings from the modem, etc., so i failed miserably.

any help would really be appreciated.
thanks in advance,

john charles taylor
jct@astro.ocis.temple.edu

1222. PBI Memory upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 16:16:04 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <BEC0C5A6586@east-01.novell.leeds.ac.uk>
Source record: 94555

was the 1090 a memory upgrade via the PBI?

I think somebody has asked why hasn't anybody done a memory upgrade via the PBI port. Well I know of at least two such devices, and in fact I actually sell one of them, the YORKY. The other device was called Q-MEQ and both devices as far as I know were only sold in the UK. Both devices only support 256k.

I did discuss taking the Yorky up to perhaps 1meg with the original developer. He said it should be possible, but not with the current design, it would need some modification and the programmable PAL chips would need changing. Another problem was he didn't know the standard for bank switching that much memory, when the Yorky was developed the RAMBO XL 256k upgrade was the most popular so he made the Yorky simulate this in respect to bank switching. I understand now that the other bits in location 54017 are used to select the extra banks in 1meg plus upgrades. Anyway to cut a long story short, the original developer has moved on to other platforms and does not want to develop a further board, so I'm afraid at the moment 256k is the limit for PBI access unless of course somebody else has gone bigger???!!!

Freedom has to be earned! Also Freedom does not mean that every
one gets to do anything that they want. It allows individuals
to do things that do not hurt others, priacy hurts other people.
It hurts the developer, the retailer, and the user base.

.
.
.

>
>What are you trying to say ? For example if someone were trying to make

I think that if anyone wanted to get an Action! cartridge and do his/her
own programs, even copies of existing Atari programs, this group would
support that person completely. But to steal the "junk food (bad example)"
off the table of the people trying to make a living on Atari software
is theft. So, get an 8 bit language and make a orignal Syn-calc+, Pac-man,
AR:The City etc. and we will support you with ideas, and help.

You give me a list of "classic" Atari games, and I bet I can name a
vendor that still sells it, new, in box, for 90% of them. To me, it
would be immoral to take away legitimate business from these vendors who
try so hard to support us.

>
>-- Dave

Although this is not something that is stated in law, I feel those
individuals who did buy the classic games still have a right to sell
their original games if they wish - and recoup some of their investments.
Its more a matter of being fair to those that did support the original
author by buying their games at probably retail price. If those same
people can now sell those games to someone else, that gives them the
cash to now move into some other market and make purchases to support
some other budding author.

When you decide that its ok to just give everything away free, there
is less of an incentive for a person to buy anything - and when that
happens, the whole idea of a market breaks down. Think about it.
Why work on something when its not going to get you money you can
use to buy food or put a house over your head (obviously I'm talking
the full timer here, not part timers who might do it just because
they enjoy programming.)

I think the loss of a secondary market hurts the overall market more
than you realize. The very people who spent money to get what they
wanted are the ones you want to encourage to continue doing that so
there will continue to be a secondary market for those who don't/
won't/can't spend as much.

Just my humble feeling of fairness: Wayne

1228. International Mail-Order business

Source record: 94559

I've seen people from UK, New Zealand, Netherlands, US thinking about ordering stuff from another country, but not quite comfortable with it. Why couldn't companies like DGS, R. GORE, FTe, etc. be able to accept credit card orders over the internet? In other words, say I wanted to buy a game from R. Gore, I would e-mail him my VISA number and order, he could take the order and reply to me that it was on the way. VISA, Mastercard, American Express all do international money exchange rates all the time (at least I've done it between Canada and US). All this could be done thru internet e-mail. The vendors would have to be very clear in prices in pounds sterling and US Dollars. Why wouldn't this work? I'm tempted to order something from UK just to try it out. The same would work if say someone from Australia wanted to order from US. Just make the transaction thru internet e-mail.

(Artem and J. King discuss piracy vs. finking.)
Artem, I think the thing you are missing is that this (the
internet) is a PUBLIC forem. By that, I mean everyone is
welcome to participate. That includes finks, thieves, FBI,
system administrators. Now, I'm sure you don't consider
yourself to be a thief. And J. King said he was 'thinking'
about sending UPENN administration your posts. The thing
you're missing is that there are many people with many
points of view. Your point of view is not necessarily that
of others here. I bet in Russia, everywhere, finks or
tattle tales are frowned on, not liked. On the other hand,
people responsible for say running the government get
information, need information, about people and activities
contrary to the government. A fink to one group could be an
important source of information to another group. Keep in
mind that what you are proposing is considered to be illegal
by some, but apparently not by you.

From: chaos@oo.com
Message-ID: <3hb6v1$ojb@tequesta.gate.net>
Source record: 94564

I got my 1020 printer that i orderd for 15 bucks today, and man
is this thing cool! First of all it was kinda neat getting the whole
package..these things are brand new, and the box it came in was even
shrink-wrapped...like it was fresh off a store shelf..heh..

Anyways its mega cool. At first i was kinda worried that it
wouldent be compatable with most printers, but it seems to work fine. I
use Text Pro word processor, and Tedit and a couple others, and aside
from the fact that its 40 cols it comes up just fine.

I was also amazed at how quiet these units are..i expected
buzzing, scratching, and what not that i usually associate with dot
matrix printers, but its mega quiet, even when its printing you hear just
a fain clickity clack sound.

Man, i wish there was some way to hook this up to my IBM. it
would be great for notes and screen caps. Yo know how it is, your
cruiseing the net and you see some adress or subject you wanna save for
later, and you dont feel like clutterng yer unix space by Yanking it, and
you dont wanna waste a whole sheet of printer paper by printing it out,
and when ya scribble it on a pad of paper ya cant read or remember what
ya wrote later.

This would be great for those little note things...just slam the
screen print button, and poof, it spits out a nice small miniature script
of text. At anyrate i still like it for my ATARI, as i dont have a
printer before and this tiny thing takes up alsmost no space on my desk,
and i can finally print out textfiles and whatnot :)

anyways, im happy and i thought i would share it with yall [G]

lovin my atari more everyday..
Ed Heffernan.

Source record: 94591

In <3h703a$gs8@news.pacifier.com> David Willard wrote :

>Get a 1 Megaohm potentiometer from Radio Shack, and some DB9 connectors.
>Someone willing to provide the pinouts? I've seemed to be missing my
>copy of De Rey Atari...

Here's what I have, from Mapping the Atari (couldn't see anything in De Re Atari though - but it was only a quick flick through the contents):

1 2 3 4 5
6 7 8 9

1 Stick forward
2 Stick back
3 Stick left
4 Stick right (1-4 are four bits of the PIA port)
5 Potentiometer (paddle) B input (analogue pin 1)
6 Trigger
7 +5 volts (recommended load of one TTL at 50mA)
8 GND
5 Potentiometer (paddle) A input (analogue pin 2)

It doesn't say directly which pins are used as the paddle fire lines, but in different parts of the book, it says you can do horizontal stick movement by using:

PTRIG(1)-PTRIG(0)

This returns -1 (left), or 0 (centre), or +1 (left)

So therefore, the paddle fire buttons are hooked up to the left/right lines (pins 3 &4), but you will need to see for yourself which is which.

Hope this helps! BTW, is 1Mohm just a close guess, or did you read this off the back of one of the Atari pots? Whatever, thanks for posting the value.

1236. Re: Super Cart Bank Switching address(es)

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 21:00:09 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <132521@cup.portal.com>
Source record: 94571

Thanks Peter, but what I meant was where does the bank switching code actually write to rather then the address range it responds to. A not so quick explaination: What I did was an expanded version ot the latch I posted. I needed to add functions to a cartridge through port, like a latch. I went in & disassembled much of an Action! cart & it looks like the only address it uses is $D500 i.e. STA $D500. I could be wrong, but that's the only $D5xx refs I found. I also love my SDX cart so I needed to know what address that used so I could leave it free. What I did was jumper all connections from the a 30 finger edge card proto board to a 30 pin socket *EXCEPT* for the !CCTRL line. The !CCTRL line goes into a !E enable pin of a 74LS138 1 of 8 decoder. The A1-A3 lines of the decoder are all tied to address lines [5,6,7]. The !0 output of the 74LS138 is brought out to the socket as the new !CCTRL line. With this scheme my Action! cart worked with my SDX & game carts seem to work also. The new !CCTRL line only responds to $D500-$D51F now. I've also got 7-SDX area or 6 more !CCTRL lines for jerking around with stuff like latches, each starting on a $20 boundary. I've got the !2 line of the '138 NOR'ed with the Phase 2 clock going into the CP of '374 latch so all I have to do is write to $D540 & the data is latched. There's some other stuff I really need to know, like where an Rtime cart is located, but I think I'll just ignore it for now.
Robert; I don't have any of the newer/higher density srams, So for me 64k would mean; either be use 8-28 pin devices which I do not have or go out & buy some of the newer srams. A 128k device is only about $16 so it could be done, but I'm pretty sure it won't be done by me! I think I have enough free time to add an 8k ram to a cart, matter of fact it & looking at the Axlon hack are #1 on my hit list. If I get it done I'll probably do my usual stunt posting an arcane ascii description like the above & giving it away. The way I'm thinking about doing it is dedicating one 32 byte slice of the cart area for use as memory I/O & one 32 byte slice of cart for latch. You'd use it some thing like: Write a zero to the latch @$D560 <for instance> to get to the first 32 locations of the ram for read/write @$D580-$D59F <for instance>, write a 1 to the latch to get to the 2nd 32 locations in the window, ... that would give 256*32 bytes or 8k. If anybody was really serious about it they could just decode the latch slice into more then one latch or dedicate a 2nd slice to another latch or use 64 bytes of space for ram locations or whatever their heart desires. I think I'm OK at programing, I'm probably better at programming then hardware as a matter of fact, but I love hardware so I'm not really into writing applications for any of the hacks I do beyond seeing them work once.

1237. Re: 1200XL power upgrade

Actually, removing the internal power supply on his 1200xl was how
Wooley got his built in IDE drive to fit.
Rick

1238. Loose ramblings & PBI stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 21:00:18 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <132523@cup.portal.com>
Source record: 94573

Wing & was it Dave or Ben or Robert or Peter or ??? Anyway, my Email to Wing bounced hard ergo a PBI PIA with some other loose ramblings. Sorry for post in the sig for those of you without a skip function. When I go on like this I usually like to take it to E-mail. I'll assume people who are interested have access to archive.umich so I won't repeat the pin outs for the PBI. Ditto for the [6520, 6521, 6821, ...], the data sheets for those puppies are everywhere & if nothing else, you should be able to salvage one from a busted Atari computer or 5200 game system. The only unusual part is the 74LS688, I think a direct pin replacement may be the 74LS521 which is just as hard to find. I'm off on this silly cart kick lately, another post somewhere in cyberspace will explain more if you read the entire comp.sys.atari.8bit. I may come back to my senses & use the PBI again. More then a few months ago I asked who had what hardware, I even got several responses from outside the US, thanks! Anyway I'd guess maybe 80% of the people indicated they had access to an XL/XE while the remainder only had a 400/800. Same time I new the MIO & Black Box take over huge hunks of hardware addresses, like $D100 & maybe $D600? There's a bunch of other internal mods like Wooley's changing the $D600-$D7FF to ram which totally blows anything else you may want to do in that area. Neither the MIO or Black Box or K Products or MIO II specs are known to me & I wouldn't go out & buy one each just to figure it out. Under the hood? Every mod Wooley has done is already there & remember the Mars Board? Last time I saw one it took up about 1/3 the surface area of motherboard. Besides, talk to some people about opening up their computer & they shudder. Anyway, I'm not trying to talk people out of using the PBI, this is just another nag about why we well never have hardware compatibility & why I started fooling with the cartridge port. Anything you do on the buss, whether it's a 16 meg memory expansion (I'll get Wooley's 1 meg simm thing up, but I only have the SLCC newsletter, not a file so I have to type it in; arrrrghh!) will be almost by definition, incompatible with everything else that is already there. Use the $FFC to $FFF addresses for Axlon switching? I don't think so, this is right in the middle of DOS & for SD, this is above memlow so it would crash a BASIC program if you tried to use it=> they really only used a write only latch of some kind at $CFC0. The problem with using a PIA is Axlon handers just expect a latch, not a LSI device so existing Axlon stuff couldn't use it without first having something initialize it. For a printer you need to have input for things like printer not ready signal from the printer. If you had a 6520 there, a read from the OS ROM would occur at the same time as reading the 6520's lines. Can't have two devices trying to drive the data lines at once. So anyway, all this implies is don't use a 6520 for Axlon compatability w/o a small number

of gyrations ergo I need to post two designs. On using 16 megs of memory, you'd need to select one of 1024 16k pages. The 1 meg simms I have data sheets for don't have ANY of the CS !CS !OE lines I'm used to. So not being a memory expert, I'm under the impression you would need something like 110+ ttl chips to decode them? That's a lot of board real estate & enough power to run a refrigerator. I guess you mean the 4 meg or 72 pin 16 meg simms? You're probably right, but I don't have data sheets. I also have trouble finding more then a couple of bucks a month or for my 8 bit & last time I checked, 16 megs of ram sells for about $500. I don't know how many of us have the combination of money & personal fortitude for that big a project. I think I get left out in the cold on both counts. FTE will probably be the only game in town for this big of memory upgrades because of the combination of 65816 & PLD access Mike's got to throw at the problem. Sounds like a couple of seperate posts are needed. I'll get up a couple. Bad news is I'm semi retired, but my part time job for pocket money is starting again so I've only got a few more weeks before I lose 80% of my spare time for projects like this.

1239. Loose ramblings & PBI stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-08 21:00:22 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <132524@cup.portal.com>
Source record: 94574

Wing; A PIA on the PBI. I've done this & it works, but there's liable to be more then a couple of transcription mistakes so if you get a chance reproduce a schematic from the connection list & trace some of the connections you know well be there from the part's data sheets; for example, D0-D7 on the PIA will be connected to D0-D7 on the 6502 or OS ROM, ditto for power & ground. Looking at the back of your 800XL pins are numbered as follows:

TOP
1,3,5,...49
2,4,6,...50
BOTTOM

Upper 8 address lines go to the 74LS688 A lines:
PBI [12,13,14,15,16,17,18,20]
'688 [2, 4, 6, 8,11,13,15,17]

PBI data lines D0-D7 to 6520
PBI[21,22,23,24,25,26,27,28]
6520[33,32,31,30,29,28,27,26]

Atari reverses A0 & A1, to the 6520, that is they tie A0 to RS1 & A1 to RS0 of the 6520. You can either go for what everybody else in the world does or do the Atari convention so JS programming stuff is consistant with the new PIA. I go Atari too.
PBI[3, 4]
6520[35,36]

'688 !(P=Q) to 6520 !CS
'688[19]
6520[23]

Misc control like R/!W, IRQ, signals to 6520
PBI[34,31,46,35]
6520[34,25,21,37&38]

Power from PBI to CS, '688 logic, ecetera
'PBI[47,48]
'688[20,3,5,7,12,16,18];$D7:=11x1x111
6520[20,22,24]

Grounds & more logic
PBI[1,10,19,29,30,32,42,45,50]
'688[1,10,9,14];$D7:=xx0x0xxx
6520[1]

The only pins left open on the two IC's after all this should be the I/O pins of the 6520, anything else & somebody made a mistake. This scheme puts the chip at $D700 just like the existing one at $D300. If you want to do some fooling around, there's an enable pin on the '688 that could've gone to an address line as well as two CS pins on the 6520 that could go to address lines. Do this & the design won't take up the entire page.

Message-ID: <FBJMEJUQUp@stingray.manawatu.gen.nz>
Source record: 94578

OK - I just checked which pins were used for the paddle triggers, so here's
the info again (with the triggers):

1 2 3 4 5
6 7 8 9

1 Stick forward
2 Stick back
3 Stick left & paddle trigger 0
4 Stick right & paddle trigger 1
5 Potentiometer (paddle) B input (analogue pin 1)
6 Trigger
7 +5 volts (recommended load of one TTL at 50mA)
8 GND
5 Potentiometer (paddle) A input (analogue pin 2)

I don't guarantee that the paddle trigger info is 100%, if not, they're the
other way round - I just checked quickly using my ST to 8bit interface,
which I use to transfer files.

The following summary is WRONG..but will work for most purposes..

Let's say you start out on a machine hooked directly to the internet.

First you make up a nice email message and send it off. Your computer talks
to your local mail machine (may or may not exist). Your message is
sent to your mail machine and held in a spool. (Between your machine
and the mail machine a lot of packets of data are sent, and if you
are using ethernet connections, well, joe shmoe in the cubical next to you
can watch all that data travel down the line). The mail machine
looks up the destination address to check if its valid, and if so
tries to set up a link to the destination address's mail machine.
It makes a link and starts sending your email to the other machine.
Your mail is broken up into "packets" that get routed to the destination.
Routed as in, routed through several other sites and machines on its way.
The destination mail machine gets the complete message, then it contacts
the machine that your destination user uses and sends it off to him...again
going through network wires.

Check out the Headers and Paths at the top of you mail messages.
Those sites are the ones that held your message, not necessarilly all
the ones your message traveled through.

PGP stands for Pretty Good Privacy. It is a way of encrypting your
messages and sending them to a recipient. Still, anybody who would
want to could see your mail, but would not be able to understand it.
Only you and the person it was meant to go to can decrypt it. AND!
He will know that it really came from you and was not forged. PGP
can get pretty complicated. But, if you ignore most of the documentation
you can get it up and running and in use very quickly.

If you think that ANY data that is transfered on the internet is
secure from people you are sadly mistaken. What is a real kick in the
but is your email is NOT protected the same way snail mail is.
Neither is voice mail as I understand it.
(In fact there was/is a controversy over the fact that the government
wants to make sure they can read anybody's email and data anytime they

want to or need to. They want a back door into every encryption concept that comes up for secure email transport. Well, you can guess what my opinion of that rubish is. FU.)

Any other questions?

Andrew

1249. PC2SIO? Maybe, but I need SIO specs...

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-09 04:34:56 UTC
From: heide@ee.ualberta.ca
Message-ID: <3hc61g$o86@quartz.ucs.ualberta.ca>
Source record: 94584

Hello! I'm looking for information on the SIO specs
(voltages, framing, etc.) and I was just wondering if anyone
knows of anything available on the net. This summer I
might take up the recently suggested project of interfacing
SIO devices (primarily drives) to a PC but unfortunately
I'm lacking information on the hardware side. I've got
the SIO2PC files, but haven't had time to sift through all
of them yet.

It would be kind of nifty if we could integrate something
like this into an emulator much like C64S does, but maybe
I'm dreaming...

(Please don't take this as a firm committment, though. It's
just something I might do for kicks. I never really got into
the hardware side when my 130XE was in working condition but
now that I've got the knowledge I feel like experimenting
a bit. :-))

Thanks in advance for any help!

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

> How is your 800 modified?

Heavily 8-) -- It's switchable between 800 w/256K Axlon lookalike, 130XE
and 320XE. I've got both OS ROMS and BASIC in one EEPROM (27C512), and
a big PLD to switch everything around. Oh, and there is an extra PIA that
gets switched in in place of joysticks 3 and 4 when you turn on the XL/XE
OS. It still doesn't have a PBI though - maybe I should work on that...

I was just about to start writing it all up for the amusment of the 8bit
community, and discovered this little problem, which I'd like to resolve
before I release the mod docs.

Well, it does go to memo pad - when I switch in the 800 ROMs. I should have
been a bit clearer, the machine has two sets of ROMS in it. The problem
occurs when the XL/XE ROMS are selected.

>I'm not familiar with the history there.

In the UK there used to be 2 magazines: Atari User and Page 6, both magazines
contained h/w, s/w reviews and news. When the Atari 8bit market started to
drop off (about 1989 ish I think) these two magazines combined to form the
New Atari User.

Free in Eastern countries? Name me one piece of commercial software that
is _free_ in the so called Eastern countries! By the way, in your Eastern
countries the Atari 8-Bit market is much more alive. For example, take a
look at Poland. They still have some 8-Bit magazines and a lot of software
houses supporting the 8-Bit (atari's, commodedoors etc.) I don't think
they like people like you, stealing their income!

>: companies out there (Best, B&C, American Techna., etc..) that are

>What are you trying to say ? For example if someone were trying to make
>living on selling junk food (bad example) would every one else have
>to buy it from that person and wouldn't be allowed to do his/her own ?

You are allowed to do your own. Turn on your computer with your DOS 3 disk
in the drive (that's probably the only legal software you have...), go
to basic, code your own DOS 2.5, MAC/65 etc. in plain machine code (i.e.
for l=..., read x, poke a+l,x, next l, x=usr(a)) Then start your MAC/65
and code your own Boulder Dash. (Still the best game for the 8-Bit atari's.
Sometimes when I'm in a nostalgic mood I even run it from my original tape :)

Wow, I' really suprised by Bob Puff's implementation of the printer
port on the Black Box.
It's my understanding that he uses a 6520 or 6821 Peripheral Interface
Adapter on the board for the printer port. If so... I think the
most efficient printer port is as follows.

One of the lines, I think it is CB2, can be configured to toggle for one
clock cycle immediately after a write to Port B, after which it
goes inactive again. I used this feature to automatically strobe
the data to the printer port. I tied the BUSY line to bit 0 of port A.
Writing to the printer port was then simply

```
LDA BYTE
STA PORTB
LOOP LDA PORTA
BEQ LOOP
RTS
```

the timing of the strobe worked, both directly connected ton an EPson Stylus
800 printer, and a 512K printer buffer that I have between the
computer interface I built (wired directly to the 800XL motherboard),
and the computer. I may have some of the bit assignments switched around
above, I have't played with the PIA chip in quite a while... but
having the PIA automatically strobe via one of the two Cxx lines
works extremely well.
Instead of wasting a bit on the other 8 bit PORT of the the PIA, I could have
used the other Cxx line as an input... disabling IRQ's when that line went
active, a
and done something like

```
LDA BYTE
STA PORTB
LOOP LDA PBCTL
AND #MASK
BEQ LOOP
RTS
```

but I was too lazy to figure out how to do that, and besides.. it
added more cycles and more code!! Bloat! Agghh!

My two cents anyway.

That makes sense, but I am doing IDE drives this week for our PCs here, and have (since my first IDE drive) standardized on the 1 inch high ones. I suspect (but have not physically inspected or tried as yet) that I could get one of those into my 1200XL without removing the power supply. I'll try it out tonight after finishing the TV I'm fixing ... put the 80 megger in and see how it fits (since the 1200XL is apart waiting for me to decide how to upgrade it). Certainly one of the 2.5 inch laptop drives would fit, though I believe most if not all of those use a smaller connector, and would require an adapter from a standard IDE controller. But now, maybe buying a used 2.5 inch drive from someone who has upgraded his laptop's drive would be an economical route to go (busily making a shopping list for Trenton).

Pete, once again I don't fool around with PBI stuff so most of what I say is either a guess or from Mapping The Atari. In my other post I said something to the effect of I didn't know how the remap of PBI ROM works. If I really had the time, I could disassemble the ROM & find out, but I have little desire to do something with the buss so... There are plenty of rumors about people that supported the Atari, like CSS, disassembled the entire XL OS for building stuff like the Black Box. Atari themselves never released the source code & everybody who may have a copy of the OS they produced themselves treats it as a trade secret. That's fair since they are under no obligation to help somebody compete with them, but it makes it a little harder to figure out what's going on. I'm not sure exactly what your modified xl is like, but absolutely one of the first things to go when people were looking for PIA pins for memory expansion were things like built in basic & I'd guess ROM diagnostics. The other thing that went was the ROM diagnostics in the OS in all the modified OS chips out there. I believe when the ROM diagnostics are active, the OS ROM that has that piece of code is $4000 area similar to the way ram banks are switched in & out. How it's called once it gets there, i.e. JSR $4000 or JMP $4000 or JMP $???? I don't know. Ditto for the PBI stuff. The bright side is Mapping gave the address of the generic parallel device handler vector! It says to just move the vector into the the regular device handler table along with the device name. Thats how the 1450 added the V:(oice) handler. If this is accurate, the address contained in $E48F-$E490 will point some where in the ROM to the PBI initialization & I/O vector tables just like the ones at $E400 area do. Are you up for some disassembling?

I may have access to some limited poster-creation facilities, I'll have
to look. What game screens are out there at umich, and which ones would
people want to see on a poster? I _do_ have the "all time favorite 8-bit
programs" list here somewhere, maybe I'll just use THAT. Pac-Man? M.U.L.E.?

AH> First you make up a nice email message and send it off.
Your computer talks to your local mail machine (may or
may not exist). Your message is sent to your mail
machine and held in a spool. (Between your machine and
the mail machine a lot of packets of data are sent, and
if you are using ethernet connections, well, joe shmoe
in the cubical next to you can watch all that data
travel down the line). The mail machine

Any other questions?

Sure. OK, so there's a mail server machine. I take it that
this machine is the one that is hooked to the internet.
What is the nature of that hookup? Is it a two-wire line
like the phone line, or a fiber optic line (which works
how?)? The internet itself. Is it a system of
wires/cables/dish-satellite sort of like the phone company?
Does this mail server know all the machines hooked up to the
internet? Is the internet basically a network like the
phone company, with local switch areas and long distance
microwave/radiowave-satellite connections. I heard the
internet is an obsolete government/military system that is
designed to withstand a nuclear attack, is very
indestructable. Is there a central place all these messages
go, with a large capacity computer routing everything?
(The internet is a Wide Area Network, no?)

I think some of the online bookstores do do business thru email,
although I am not surewhether they use PGP for the account info,
or set up an account for you thru voice contact.

It cannot be emphasized enough that EVERYTHING that goes thru a
gatewayon the Internet could be monitored by anyone with physical
access to the hardware. The Internet protocol is an open
broadcast over coax or fiber, an any access to the media means
access to the data. Encryption is the only security. Which is
why encription and PGP and public usage, free and open, of the same
is so important. Encryption is the only envelope available,
anything else is like sending postcards thru the mail.

>an 8-bit VGA card might be too.

Well... I cannot say, that I am not interested to your info. But I can say,
that I am not interested to a card, that allows to connect Atari to PC,
because I haven't a PC, off course. I have thought about a PC graphic-card
(VGA or SVGA looks the best :)) to be connected _directly_ to the XE-bus
(or what you have in your computer; I have the XE). As I have written yet,
software doesn't look to be difficult to develop, but I think, that it
shouldn't be loaded from the (hard) disk, because a graphic handler like
this will take lots of memory (it is first point), and our computer won't
be able to print anything on screen before program is loaded (= during
booting; it is the second point).

Due to points specified above, our hypothetic VGA-handler should be (I think)
installed on the (hypothetic) VGA-interface as a 'new-device', then it should
install both screen-devices (id est "E:" and "S:") as the CIO-new-devices.
'New-device' handlers are easy to write, I have written yet something like
this for interface, that have been developed to connect a PC as a hard drive.
It have worked fine so far.

The VGA-card bears another problem: screen accesses are possible through the
64KB address-area. Unless we have not the 65C816, we cannot insert it to the
CPU address space directly (it is the great point to have a 16-bit CPU into
Atari). The VGA-memory area sholud be splitted (is it a correct form?) into
at least four parts for 640*480/16 graphic mode, then shouldn't be inserted
but in $4000-$7FFF (like many standard memory extensions) and swithed on/off
by a special port on page $D100. There should be several another ports spe-
cific for the VGA, that allow to select a bitplane etc. This way we can do
accesses to the screen memory on the card <although it often have over 512
kilobytes of RAM, it allows to read/write the RAM using 65536 adresses only,
and set points in different bitplanes by one instruction; VGA have been de-
veloped for very slow and very primitive computers, like PC's ;) >, and
because of it we cannot load a screen handler to extended memory banks. If
our Atari has the 65C816 CPU, we haven't any problem, off course, due to

16MB address space.

If we install a VGA card in our beloved computer :), we can piss off the ANTIC and GTIA then easily accelerate CPU to, for example, 3.54 MHz.

I hope, that You can understand my English.

1272. What are the Ataris being used for?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-09 16:48:53 UTC
From: tel4@Lehigh.EDU
Message-ID: <3hdh1l$57oq@ns1.CC.Lehigh.EDU>
Source record: 94513

Hello Atari Enthusiasts:

I checked out this newsgroup because I am one of the original Atari 800 owners.

Mine is packed away in the basement because I thought it was useless. I guess
I am wrong since there is a newsgroup dedicated to Ataris.

Would someone please tell what the Ataris are being used for?
Maybe I could then dust mine off and get some use out of it.

Thanks
Ter

:
: Sure. OK, so there's a mail server machine. I take it that
: this machine is the one that is hooked to the internet.

well, yes, so can your machine just as mine is.

: What is the nature of that hookup? Is it a two-wire line
: like the phone line, or a fiber optic line (which works
: how?)? The internet itself. Is it a system of
: wires/cables/dish-satellite sort of like the phone company?

Yes, to every one.

: Does this mail server know all the machines hooked up to the
: internet? Is the internet basically a network like the

It looks up the name by asking a Domain Name Server (DNS lookup)
where to send your mail (usually MX routes) if that server
doesn't have it it will tell your mailer where to find a DNS that
can answer its questions.

: phone company, with local switch areas and long distance
: microwave/radiowave-satellite connections. I heard the
: internet is an obsolete government/military system that is
: designed to withstand a nuclear attack, is very
: indestructable. Is there a central place all these messages
: go, with a large capacity computer routing everything?

yes and no. As I recall there were 4 large companies that
managed a large portion of the internet. But, technically, everything
that is connected to something else is part of the fiber of the network.

For instance. My personal machine has its own internet address.
akh104.rh.psu.edu. It is wired using ethernet to a HUB in my building.
which is then wired (wired! like phone wire) to a HUB in the Eastern
part of my University. Which is then wired to (god only knows where)
some other machine which is hooked up via fiber optics or heavy cable
to some other big university. etc... and on on on on on

for example... for me to get from State College PA to Allentown PA
(and I have no IDEA WHY this is the route my data takes, but it is)

My machine to #1
1 128.118.192.1 (128.118.192.1) 3 ms 3 ms 3 ms
2 tbfddi1.gw.psu.edu (128.118.100.1) 5 ms 4 ms 5 ms
3 192.5.159.10 (192.5.159.10) 4 ms 4 ms 6 ms

```
4 dgb-psu.cic.net (131.103.25.81) 41 ms 40 ms 39 ms
5 dgf-fddi0.cic.net (131.103.1.19) 31 ms 44 ms 36 ms
6 umn1-dgf.cic.net (131.103.9.82) 118 ms 140 ms 136 ms
7 nsf-gw.msc.net (198.174.96.3) 133 ms 147 ms 124 ms
8 * gw11.msc.edu (137.66.13.231) 146 ms 165 ms
9 aip-gw.msc.edu (137.66.220.245) 225 ms 195 ms 278 ms
10 destination 198 ms 188 ms 204 ms

there are 10 places where my data is routed. and anyone at those
sites or between those sites can look at the data if they wanted to.

[dreams about SVGA on the 8bit]

Why VGA/SVGA? ahhahah funny. Why not just CGA or EGA.

I was thinking more along the lines of 8bit serial/parallel cards
or even 8bit mfm floppy and harddrive cards! and 8bit networking cards
etc...

The first thing would be to get a multi i/o card up and running...
then move on the floppy. etc.

Odd favor to ask, but I've never met Tom Hunt & his bbs is not a local call
for me to say the least! Could somebody that uses the CTH bbs ask him a
question for me? It's been said that he prefers SD over other DOS's & if
it's true I'd really like to hear his reasons. I also need to know if he
makes SD only programs, if so why?
an email reply would get to me quickest.
Thanks
Rick

Russ.Gilbert@apk.wariat.org (Russ Gilbert) writes:

>I've seen people from UK, New Zealand, Netherlands, US thinking about
>ordering stuff from another country, but not quite comfortable with it.
>Why couldn't companies like DGS, R. GORE, FTe, etc. be able to accept
>credit card orders over the internet? In other words, say I wanted to
>buy a game from R. Gore, I would e-mail him my VISA number and order,
>he could take the order and reply to me that it was on the way. VISA,
>Mastercard, American Express all do international money exchange rates
>all the time (at least I've done it between Canada and US). All this

Security is the big issue. As Andrew was trying to point out, every
e-mail message passes through many, many machines, every point at which
is the potential for someone pulling your credit card number from your
message.

What I wanted to point out, is that there _are_ companies selling their
wares over the Internet, inviting credit card orders, etc. CDNow comes
to mind: telnet to cdnow.com or point your www browser to
http://www.cdnow.com/ (not necessarily right, but close). They do a
large amount of business over the Internet, by convincing people it's
safe to send them their credit card numbers. I guess my point is, the
chances of someone actually stealing your credit card number from a mail
message are probably not very high, but you have to remember that the
potential is there.

Well, Lawrence....I can't remember how long it has been since I sent you $10 for some game carts, but I haven't received any replies from you.

I sent you a message in E-MAIL, but I didn't see a reply today, and now I see a new ad dated yesterday, 2/7/95.....and still no reply.

It's been so long that I have changed my mind. Will you please send my back my $10? I am now beginning to get concerned that I'm being ripped off.

If you haven't received my E-mail, then perhaps you'll see this on one of the newsgroups in which it is posted.

Awaiting your reply....

James

Sure did, from an article he wrote in Atari Connection:

"With another four months of polishing, the new Eastern Front (1941),
which is now available on cartridge as a main-line Atari product, is
immensely superior -- more levels of play, the opportunity for longer
game play, more of the parameters of the actual battle brought into play."

There is a "Scenario Editor" for the APX version, I think B&C listed
it.

Dave; I think Wing's in Australia. He took it to email to explain his problems with parts/sources/vendors. I should reread his email, but he more or less just wanted a knock around project as he has a clone with a laser printer etc. Anyway, I doubt if there's a MPP board anywhere in Australia an darned few in the US. He seemed to want to build something in his schools electronic lab vs solder a kit. Wasn't interested in buying an 850, PR:, ... either.

My girlfriend's atari is being used for

a) lesson plans with an XDM121 letter quality printer and AW+
b) superbreak out
c) keeping track of her finances with the old Budget and Cashflow disks.

My atari is being used as a store house for all the atari software I own.
And they are laying around the house doing various things, gathering dust,
sucking down power, waiting to be upgraded...etc.. like this 1200XL
under my bed...waiting for a capacitor. =)

If you can't stand the flicker in FT80, you can either:

1) turn down the contrast on your monitor; I found that I can nearly
REMOVE ColorView rolling and flickering on my Commodore 1084 monitor
by turning the contrast to nearly off. Looks awesome.

2) Get Ice-T, the "other" new 8-bit 80 col. high-speed VT emulating terminal.

I've not used a modem on my Atari in a long time :(so I never use either..
others will of course have pro's and con's to share between the two though.

Well, Line-Up is more like Columns...

>Wierd.. can't wait to see it! :)

I forgot to mention about the pause key.
If you press "P" during the game, a cool 3D effect appears.
Then, return to the game with "ESC".

Also, there are some loading keystrokes that
enables, changes, disables or bypasses
playfields, music, sounds or presentations.

I don't know about unlimited-lives-magic-keys... Sorry!
But you can still get more lives by reducing special units
or every 10.000 (100.000?) points during the game.

1288. Atari 8-bit Windows Help File

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-09 22:20:15 UTC
From: nagual69@aol.com
Message-ID: <3he4ev$6kn@newsbf02.news.aol.com>
Source record: 94528

The Atari 8-bit Hypertext Help file for Microsoft Windows is (albeit too slowly) progressing nicely, but as of lately I have been too busy searching for needed info in cyberspace, and unfortunately not finding any. So I must ask for your help, because the sooner I compile the info I need the sooner I can Post a BETA copy up and all those who have access to a windows machine can beta test it for me.(grin) ;)

Here's what I need:

Copyright information. - Examples on copyright law, (for both the help file and for the
shareware programs referred to in the
file.)
DOS Information - SpartaDos. - If anyone has some docs, or just wants to put in a good
explantion or hints or etc. Send me a note.
I can't find the docs on it
anywhere. (PS if anyone has a Sparta 3.2x
ATR disk - mail it!)
Upgrades - Have any files on hardware hacks/upgrades for the 8-bit? I'll put them in!

Everyone, and everything (Faqs, Vend/Dev, DOCS from programs,etc) All cited, (with, as current as possible, addresses, e-mail, etc) is going be in this file. I'm dropping in everything I can get my hands on, and am planning on adding more and more, and I hope you will enjoy it!

And if I can get you to support the my effort by mailing a VERY few $'s, I will take the index and jump points and upgrade to a unix connection and set it up as a WWW site! (GRIN!) ;)

This will be my attempt to jumpstart the remaining Atari 8-bit market, by hopefully reaching many who have left their 8-bit gather dust in the closet while making Intel and Microsoft rich, and showing them the true beauty of both.

What do you think?

Thanks ahead of time,

Nagual Concept Systems
Toby Schmeling

Well, tons of people here think you're a schmuck. Does that mean it's
true?

Opinions are like rear ends. Everyone's got one and their usually full of
crap. So I throw money into a dead computer. I guess people who sink
money
into restoring cars are too "f*cking rich" and stupid. I guess those who
give
money to a church are complete as*holes ("hey man, you don't have to give
so
why do it? Sh*t dude, you're stupid.")

When it comes right down to it it's my money, I'll do with it what I like.

Oh yeah, learn the location of your caps key.

Yep, And here in the netherlands we use .DC3 for DISKCOM 3 because where
you diskcom a disk with diskcom 3 you CAN'T UNdiskcom it with older
versions of diskcom.... So when you find a file on the ARCHIVE with DC3 it
is from europe or the Netherlands...

(Yes, I'm pretty much a lurker here, but Rick knows me, and shouldn't
be doing such things as using a whole page for a silly little 4 address chip.
)

Rick - check out my multiple pia upgrade on one of the ftp sites. Some min
tinkering with it would allow 64-pia's to exist in the $D3 page currently
being hogged by one. In addition, while it would require an extra wire comin
out of the machine, you could avoid almost all internal wiring and just attac
it to the PBI.

Tell me, Craig (self rigteous, self-appointed master of the PRO!
network), how the HELL are you supposed to let folks SAMPLE internet
messages, if they are inaccessible to an existing message base?

A: Ah, ok, Ill tell you. Ask for a new base to be created and put
these messages in there. Then ask sysops to take the base as a trial
to see if theyd like it. I believe I was making a gesture to you on
this front in my post. I saw that some people did not like the posts
in the 8 bit sig (NOTE NOT ME-YOU TURKEY!), and I was only
advocating the creation of a NEW base for these posts. For the
record, I am not part of the crowd of people who complained about
the messages being there. I am only offering you an alternative way
to connect the boards into this net if youd like to do so. I felt
you were obviously frustrated as I read your post here (which I felt
like you were throwing your hands up and quitting on the idea). I
am not "master of the Pro! net", or even self rightious either, I
was trying to *HELP* you!!! I think you owe me an apology for the
"character assassination". And your "I had to post them there"
explanation does not jibe. We make new groups all the time, people
would find it and post in it. You just blame me for all the trouble
the others gave ya over your posts..SIGH! Im not the enemy ok?
Lighten up, how about giving this idea a try?

Thanks for your offer. I'm looking for Scott Adams's SAGA series (the
12 classic adventures in the graphics version). Where can I get them?
[BTW, this is not a challenge or anything - I'd just like to play those
games, and I was not able to find them anywhere, neither for the Atari
nor the Commodore 64.]

Generally speaking, if a game can still be bought, people should buy it.
However, your 90% figure is highly unlikely - 10% would probably more
correct.

> Seems pretty simple to me. :) Do you want to break the law,
>or not? :)

Well, that's what they teach you in kindergarten, but real life is not
that "simple". You're lucky if you've never broken any law, but most
people do so from time to time, whether it's tax return or crossing the
street when the light's red. It all comes down to what one believes is
right, what one can justify in a moral sense, whether one interferes
with other people's interests etc. There are areas where such decisions
are easy to make, where the black/white picture which you prefer applies.
With "pirating" lost software it's more like gray...

Ya know, you have a way with words. Your probably peeved at me cause
I asked you to put the messages in a totaly new base, a programmer
or two didnt (at your request) do what YOU wanted them to, and
everybody is a narrowminded moron because they didnt drop dead and
jump on your bandwagon.

We arent a bad network. You yourself continue to belong to it, and
network to us. I think your making a lot of black-eye accusations
about our network, and it doesnt actually improve people's mind-sets
about why a link to the PRO! net would be a good idea here.
If its so bad, why I would hate to think about how why youd want to
make this kind of effort in the first place. Im probably the only
person who went out of his way to write you about making a base to
link these messages, and you copped an attitude on me too..I net to
Bill Bingham and it would have been a good idea to work something
out. Everybody else in the net (sysops and users) are pretty cool,
I think you just got up on the wrong side of the bed or something.
Unless Im mistaken, one PRO person offered some help...

It would be easier to say what my Atari *isn't* used for. :)

But, to most succinctly answer your question, I use my Atari
for everything that I use computers for, other than running my BBS.

I use my Atari to call out, write letters, do spreadsheets,
keep track of things with a database program, play games, program,
etc.

Anything the average user would want to do with a computer,
the ATari can do . . .

Yeah, 50 messages a day is pretty dead. Not!

And ATari 8-bit computers are dead, because there are only
at least 3 or 4 magazines devoted to it, dozens of retailers and
vendors making money from it, and thousands of people enjoying using
them. Yep, that is one DEAD platform.

In article <3hc61g$o86@quartz.ucs.ualberta.ca>,
Cameron Heide <heide@ee.ualberta.ca> wrote:
>Hello! I'm looking for information on the SIO specs
>(voltages, framing, etc.) and I was just wondering if anyone
>knows of anything available on the net. This summer I

I don't know if all the technical documents are on the
atari.archive.umich.edu site or not, or just the framing stuff,
but all the info is in what is refered to as the "Technical
Reference Manual", published by Atari way back when, and I believe
available from the vendor in the FAQ.

As far as voltage requirements and such ....

Peripheral input spec -- vih = 2.0 v min, vil=0.4 v max
iih = 20 uA max at 2.0 v input
iil = 5 uA max at .4 volt input
Peripheral output spec -- Vol = 0.4 v max at 1.6 mA
(open collector bipolar) Voh = 4.5 v min with external 100 K ohm pullup
Vcc/READY input -- goes logic low on open circuit
vih = 2.0 v min at iih = 1 mA max
vil = 0.4 v max.

Note these are typical TTL type specs, design for a peripheral
output of an open collector type gate. Looking at the 1050 print
I just got in the mail, they use a CA3086 transistor array to
implement an open collector output, as well as three inputs for
the data, command, and ready line. The data and command are just
a 100 K resistor in series with the base, while the ready line is
a 10K/4.7K voltage divider in the base, giving a 2.0 volt or so
turnon point. The 800XL (print I have handiest) has 100 ohm
resistors in series with the outputs from the Pokey chip, with a
4.7K pullup resistor at the input, and a .001 uF capacitor at the
external world interface.

Pin assignments -- which I think is in the FAQ ..

1 -- clock input
2 -- clock output
3 -- computer data input
4 -- ground
5 -- computer data output
6 -- ground
7 -- command bar (output from computer)
8 -- motor control (output from computer)
9 -- proceed bar (pulled high) (not used)

10 -- +5 v / ready -- 5 volts at 50 Ma available from the computer
11 -- computer audio input
12 -- +12 volt at indeterminate power
13 -- interrupt bar (pulled high) (not used)

The 1050 disk drive uses only the data input, data output, ready, and command, thus it has three inputs and one output. The motor control line is intended to drive the cassette deck (though I used it as a baud rate switch in my ole 6809 SIO2PC type interface, to enable the 6809 to look like a cassette deck).

A synopsis of the bus operation is briefly, a command frame from the computer, then an acknowledge frame from the peripheral, then (if needed) data from either the computer or the peripheral, ended by an operation complete from the peripheral. For details and timing, there is no substitute for the Technical Reference.

A slight note on timing ... given the 4.7K pull up internal to the 800XL, and the .001 uF capacitor on the bus at the computer, this means a 4.7 uS time constant, or a 10.3 uS rise time at the Pokey chip minimum. Cable capacitance will slow this down (gee, maybe I should measure a typical cable), but if we assume perhaps another 500 pF (probably the right ballpark for 10 feet of cable or so), this would make the rise time about 15 uS. Fall time should be much faster, say 20 percent of this, but inequality would cause bit width distortion, but say this might give a maximum data rate of the order of 50 K baud on the SIO bus, about what the high speed disks and drivers get.

Yeah, I was blowing off steam and you were the recipient.. My apologies.
It's just that after so much work trying to get it to work, and all I
got were bitches and "why dont you put it in a separate base!"

>A: Ah, ok, Ill tell you. Ask for a new base to be created and put
>these messages in there. Then ask sysops to take the base as a trial

Pretty impractical option, as most BBS's are already up to base 31 --
and irregardless, it was just a test, not a full fledged port
of csa8 and the Pro! network. I stand by my decision to put those
4 messages in the Atari(8) base.

>Lighten up, how about giving this idea a try?

Na.. I'm bagging the idea. First impressions are very strong with me, and
I didnt get ONE supporting reply from my initial test messages. If the
Pro! community wants Internet messages, let them pay for their own feed
like I do!

Shoot, I think I DL'd & read it the 1st week I joined Portal. For anybody that doesn't know Chuck by his name, he did several WELL documented hacks & mixed in probably the cutest programing hack I'd seen. Copied OS to RAM, modified vectors, installed a ramdisk handler, installed boot game <Ultima II or IV???> image, jumped though the OS disk boot routines & you end up with a copy of Ultima running from ramdisk! It's how Ultima should have been done in the first place!
Yes, I should take it down to 4 mem locations. I think Jeff Mc made some of the same comments when we were talking about using a 2nd 74LS138 with the unused !E/E lines being used to force all the existing hardware <few exceptions> into the lower half of their pages & making the top halfs free for another 8 devices. As I get older, I get lazy. I wait for people to ask, "I've added the one chip & it just isn't enough. How do I add another one?" So far nobody's asked so I save having to add another chip & dozen connections to my description that way. People have a real aversion to piggy backing chips & running the one jumper internally also. But then, maybe I should just start forwarding your hack, it was certainly better written up & I'd have even more free time for lazing.

>Well... I cannot say, that I am not interested to your info. But I can say,
>that I am not interested to a card, that allows to connect Atari to PC,
>because I haven't a PC, off course. I have thought about a PC graphic-card
>(VGA or SVGA looks the best :)) to be connected _directly_ to the XE-bus

That's what the named interface is about. It does not connect the atari
8-bit to the PC-bus, but it allows one to connect cards, which should be
plugged in an 8-Bit ISA socket on your PC, to your atari 8-bit cartridge
port.

[VGA card stuff removed]

Why a VGA card? Ever thought of the tremendous amount of disk space needed
to store a 320x200x256 picture? I think a CGA card would be great enough.
Good quality 80 columns display! That's what's all about. Or maybe an
old fashion SoundBlaster, you know, the 8-Bit ones. I doubt if you can
get the DMA to work, but the sampler and the ADLib certainly add some
to your XL.

>If we install a VGA card in our beloved computer :), we can piss off the
>ANTIC and GTIA then easily accelerate CPU to, for example, 3.54 MHz.

We can not. ANTIC also generates the RAM refresh cycles.

Lets face it,pirates are the lowest forms of life out there.They are often sad little individuals who,because in every-day life they are nobodies,try to give themselves a feeling of importance.I feel the PIRACY subject should forever be laid to rest;ignore the cretins when they speak but report one if you know who they are.That's all you can do.I for one would give this message to all "pirates":

GET A LIFE.

Aha ! My 800XL has the 'inverse video' control key, and yet on the photo on the manual it has
the 'boxed' version. Hmm, I was always confused as to why products never look like what's on
the packaging, I mean, subtle differences like that. I often wondered if the manufacturers
made different versions to be sold !

Looking at the 800XL prints, and being a hardware kinda guy, I
might suggest pulling the PAL and putting it on a solderless
breadboard. turning the PB7 input on, and seeing which address
lines trigger the OS ROM output. You would also have to simulate
the other inputs properly, such as pulling REFbar high, and the
other PBx inputs.

> (The internet is a Wide Area Network, no?)

Seriously, read the articles in news.announce.newusers, they
explain the history and details much better than any message can.

Basically, the Internet is all of the above ... it is connected thru fiber, twisted pair, satelites, phone lines, wireless radio connections, and probably a host of other connection methods. It is distributed, there is no central control authority or depository site. You might think of it as similar to radio, with one computer talking, and ALL the others connected to that section of Internet listening. Combine that with the fact that a great deal of Internet sites are on college campuses, and you have just about no control over the route your traffic takes, and that campus sites have security issues very very low on their priority list, and you can readily understand why there is no guarentee of security. Everything is effectively broadcast to a large number of locations at once. Only the desired target actively listens and communicates, but every other system on that section of the network can hear.

There is no central authority routing things ... it is a lot like the highway system, especially if you combine it with footpaths and railways and airways and waterways. No one tells you how to go from New York to Los Angeles, if you want to you can go by way of Taiwan. There are conventions designed into the controlling software, but with no central control, and hundreds of different versions of software, and dozens of different routing algorithms, you never know (unless you are in an isolated corporate network, like I am in AT&T, which acts like an island to itself, with traffic into and outof the island strictly controlled).

The reference you understand to government involvement is that what we know of today as the Internet had its beginings as a university/government research network for sharing research data, known as DARPANET. But Internet means interconnected networks, each network is unique, and has a unique history, controlling entity, andso on. You have thousands of these individual networks all tied together, forming what is known as the Internet.

In the conventional transportation analogy,
Internet == Transportation Network
wire/fiber/coax/phone == roads/footpaths/airplanes/railroads

James,

I did reply to your message yesterday. I have no other pending mail in my mailbox so I assume that this is the message that you are referring to. I was extremely busy with some work-related matters the past couple of weeks and I fell behind in my processing of orders. I shipped a large number out on Monday and your order was one of them. From what I can remember it has only been 2 or 3 weeks since you placed the order. I made some shipments in mid-January and I know that your order was not in at that time. Your order should be on its way. I am not trying to rip anyone off...I am just trying to clean out my closets of extra Atari stuff. I am sorry if I dropped the ball in your case with a delay in shipping them out, but I am up-to-date on things now and I appreciate you bringing this matter to my attention.

Please let me know if your order does not arrive within the next week or so. Once it leaves here it is in the hands of the USPS!!

>been a bit clearer, the machine has two sets of ROMS in it. The problem
>occurs when the XL/XE ROMS are selected.

Well, the problem is very easy to solve !
When pin 7 of port B is switched, the part of the ROM from $D000 until $d7ff
(which can't be used normally because of the I/O Adresses) is mirrored
to $5000 and there is the self test of the XL-machines.
It's a very simply logic managed by the MMU.
I've had the description of the MMU , but it's not so difficult to find it
out !

poOr snip the power line in your cable. You aren't going to need it
poanyhow, unless you're running a P:R: or XM301.

whoa here. The 850,810 and 1050 use the +5v power line. Both drives use it
as a ready status and the 850 uses it for reset, so that is not a good idea.
Altho it will not hurt the drives to much to go with out.

rlpoint of view available in the same time period. I think the 6809
rlwould have been a much better choice, as an example. Pertaining
rlto the specific complaint related to in the above paragraph, the
rllack of 16 bit data manipulation instructions, even the 1802 based
rlElf that I started with could load and store 16 bits at a time.

I have some interesting information on some of these processors.
the 1802 has 8 clock cycles for 1 machine cycle. Its instructions take 2 or
3 machine cycles. That is 16 to 24 clock cycles for EACH instruction.

The 6502 has 1 clock cycle for 1 machine cycle. Its instructions take 2 to 8
cycles.

the Z80 and the 8080 has 4 clock cycles to 1 machine cycle. Its instructions
take from 1 to 5 machine cycles. that is 4 to 20 clock cycles.

The 6800 is simillar to the 6502. Don't know about the 6809.

As you can see. the 6502 is about the fastest processer here. The 6809 may
be a better one but i cannot say if it was avialable when atari desgined the
800 (about 1978) . anyway atari already used a cut down version of the 6502
in the VCS system anyway. why should they change??

Source record: 94465

>>Is there any way to get the Indus GT drive to read, format, and write
tlin/on
>>DOS 2.5's 1024 sector enhanced density?
>

Yea but your indus MUST have version 1.2 roms in it. to tell if it has,
insert a formated disk and press and hold the track button and press the
drive type button. this will command the drive to do an immediate disk
analysis only in version 1.2 rom. The drive will step back to track zero and
report the disk type.

>Yep. But unless you boot from an ED disk in that drive, you have to
>switch the drives density manually.

Not true. Mydos and spartados will switch the drive to enhanced to format
disks.

> It's been a while since I had an
>Indus, but I remember that you hold one of the buttons while pressing
>another one. (Sorry I can't remember which buttons.)

hold down DRIVE TYPE button and press TRACK button. Will cycle 1A, 1B and
1C. A is single, B is double and C is enhanced. The number 1 will show
number the drive is switched to ie any number from 1 to 4.

tlShould the rear dip switches be set to single or doubl
tldensity for this trick? Anyone?

doesn't matter. That only sets the drive to what the switch is when the
drive is turned on. The indus will workout the density of the disk when a
new one is inserted and dos or whatever access the drive.

1332. Credit card ordering.

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-10 16:32:02 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <C19EB6D2C4B@east-01.novell.leeds.ac.uk>
Source record: 94467

The idea of sending credit card numbers via e-mail is in theory an easy, cheap and reliable(!) way of ordering and paying for goods. I recently enquired to somebody about doing it, but he suggested that e-mail is not secure enough to send something as important as a VISA number about. After hearing the recent reasonings given out over the Digest I tend too agree. Of course encryption is always possible, or maybe you could send your VISA number in two or more parts in separate messages, after all half a visa number is no good too anybody, or is it? If e-mail fails we could always use the telephone.

Anyway, as regards me accepting VISA numbers for payment of goods, I'm afraid its not possible. To be able to accept VISA etc cards in the UK the banks insist you have a turnover of at least #15,000 and they are not really happy at that. My yearly turnover is less than 1% of that so you can see theres no way at all I can take credit cards. That figure for my turnover probably gives you an idea that I am a part time supporter and that it is not my means of making a living, and also the current level of support.

So you can see when people accuse you of trying to make huge profits by selling software they are talking out of their expansion ports. By the time royalties, postage and media costs are taken into account there is virtually nothing left. In todays world almost everything is geared towards money and making a profit, thats just the way I see the developed world's economy and motivation.

I would say most of the small time people and some of the bigger businesses enjoy the programming etc they do to help support the 8-bits, sure its nice to make a bit of cash to cover costs and maybe enough to go out and buy a beer or something at night, then somebody comes along and says well you should be giving software away free, it doesn't matter that you've spent time and money on it it should be free, oh and if its not free then I'll pirate it anyway!!! Isn't that just a great attitude to have?

And one final thing, if everybody pirates software and gives it away free in Eastern Europe and they are all happy with this situation, why is it that some of the most sophisticated newer 8-bit disk software protection techniques are being developed in Eastern Europe?

Wow! You're actually going to purchase software? Cool! Very glad to read that.
Your best bet right now is American Technavision (dont have a phone number handy, but it is in the FAQ). They have almost all of thier games for around $9.00/each and less!

This one is a jump'n'run type of game. You are Indiana Jones
and thus you have to challange various dangers inside a cave-maze.

Graphics is made of redefined charsets, looks pretty simple,
quite nice though.

In this game you have to walk though the cave looking for keys
and other stuff. It's been ages since I played it the last time.
I think if you like jump'n'runs you should get this one.

Hope this helps

Try calling my Atari BBS. It has over 300meg of 8bit files online.

The Atari Connection BBS
801-969-1468
300-14.4k bps
24 hours/day

Maybe this will help you find all the "soft" you're looking for, and we can end this silly flame war about piracy!

Dang, I brought in my catalogs yesterday, but not today. Thanks for taking my offer seriously. Have you looked at the B&C ComputerVisions or American Techna-Vision catalogs? Off the top of my head, I think they both list the 12 pack of Adams adventures. But your mention of graphics versions may work against me, because I wasn't aware of multiple versions. I'll get back to you when I'm armed with catalogs again.

If anyone else can jump in with an answer, feel free. :)

>Generally speaking, if a game can still be bought, people should buy it.

Well, we were talking about "classic" games, so it'll have to depend on how we want to define that. :) I still think the figure would be closer to mine than yours though, depending mostly on how far we want to go to locate the titles. There's an awful lot still available out there.

Computereyes! I'd like to try one of those again. I used one
once, back in the old days, when video cameras were expensive, rare, and
not very good (in low light, anyway). I'd like to make up some digitized
pictures once again. Anybody know where a good, working Computereyes can
be had?

Now (in these days of 256-1.67m color GIFs) that digitized photos
look like pictures, digitized pictures aren't any fun anymore. I always
thought they were novel, in GR.9 (or whatever mode they ran in)

One more note on this: Be conservative with the diodes, since each
one has ~0.7V drop across it. 4.3 volts is better than 0, though.

Source record: 94482

I agree the 8-bit is not dead!

"An old computer never dies, it just acquires dedicated users!"

200 games is not really all that many compared to how many games are available. Does anybody have an idea of how many games there are for the Atari 8-bits?
I'm glad the person who said he has 200 games has original games, however the letter is a little bit sad. If you know where to look you can still find new Atari 8-bit software and hardware as well as stocks of the older titles. If you don't know where to look then check out the vendor/developer lists.

In the UK most of the computer shops stopped selling Atari games when users stopped buying the software in huge numbers. They moved on to newer, more expensive computers where the profit margins were higher. Actually it is generally considered that the software distributers were the cause of shops stopping selling Atari 8-bit software. To quote Harry Nadler of Red Rat Software,

"Whats the point in writing new software if nobody will distribute it for us?"

And these people had their own shop (in Manchester, England).

As far as I'm concerned (others of course will probably have different
preferences) I'd just like to see lists of mods (filename, one-line
description), then any I don't have already I'll ask for, and I'll put
what I can on my web page.

I do have the PARA1050 file somewhere around here.

I think there are already some things on umich, in the Mods directory.

I should check the freenet for that stuff -- it's been a long time
since I've done any exploring (or just about anything else) there.

>
> We can not. ANTIC also generates the RAM refresh cycles.

Generating DRAM refresh isn't that hard, the main objection to this has got to be that by the time you pull out ANTIC and [C/G]TIA you don't have an 8-bit Atari anymore. All you've got is a 6502 box with a POKEY wired to it.

If you really want to do an interesting hack, why not double the clock speed and leave the video generation circuit in place. Since ANTIC only generates read cycles, you can then defer it's requests by one 'new' clock cycle and still get the data through in time (if you had reasonably fast RAM). You would need to put a buffer between the ANTIC address outputs and the system address bus, since it would now be on for 2 bus cycles.

You could even put an async bus interface between the video side and the CPU, but in this case you would probably want to do the refresh on the CPU side, and ignore the ANTIC generated stuff (since it would cost too many cycles to sync up).

Or, if you are getting really silly, you could build a 125nS T/cyc memory subsystem, run the 6502 at 4MHz and use the bus dead time (half the cycle) for refresh/ANTIC accesses. Possibly you could even use SRAM for this and run the extended memory more slowly - but then you couldn't do 130XE style ANTIC banking.

And no, I haven't tried any of this on an Atari, although I did once build a dual-processor shared memory box, using a pair of 6502s with their clocks running in antiphase, so I know that works.

I really must try this stuff, and report back on the results.

Pete

Richard Gore; Not that I'm naturally the kind of guy that likes to circumvent proceedures, but what you may want to try is getting someone else with a larger volume/Visa billing set up to let you use their system. For instance, if there's a local coffee shop or something that takes Visa, they may be willing to process the transactions for a lower free then what it takes now. Just a thought anyway. If nothing else you may be able to exchange the right to put a $6 software charge on their account for a cross bun & Cafe Latte<g>.

>are easy to make, where the black/white picture which you prefer applies.
>With "pirating" lost software it's more like gray...

Oh, please.

Sure, there are grey areas. No, I don't see everything in black
and white.
But, your affirmatin that pirating lost software is a grey area
is false. Legally, it is *not* a grey area. It simply is not.
You seem to be confusing morality and ethics with legality.
Morally, it is wrong to steal. That software belongs to someone (or
some company), not to the public at large. Therefore, taking it is
morally wrong.
If you are talking about ethics, then you may have a point.
An argument can be made that no one would be hurt by the pirating of
software which is no longer produced nor sold (ie, BEST, B&C, etc.
do not have copies of it for sale).
However, the vast majority of readers of csa8 feel that pirating
of even this software is bad, as it promotes an image of our community
that will dissuade those few programmers and vendors from supporting
us with new product.

1356. Processors

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-11 03:20:21 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <132672@cup.portal.com>
Source record: 94497

I prefer the 6502 series myself, but my first system was a home built
1802 system also. The reason I like the 6502 is because of it's sparse
instruction set & low number of tics to execute about 1/2 the instructions,
but I can see why an 1802 was used for a lot of applications. You would have
had to been around (Sorry if you were & I don't know it) in the '70's
before there was an Atari Computer to fully get a grasp on the problems
at the time. My first Elf only had 256 bytes! I think I paid something
like $11 for for the two 256X4 bit CMOS RAMS. It only had a 32 byte monitor
program for loading hex values into memory, displaying memory, & executing
programs. From a data storage standpoint, the 16 bit registers were just
like having an extra 30 or so bytes of ram. James Harris & I got into a
dualing code demo for 1802 vs 6502, & there is just no way even one
of the greatest programers can write code tighter then a hack on an 1802.
I think the comparison I did was a block move on the two processors. With
the 16 bit index registers of the 1802 (& I think the 6809 has them too)
vs the 6502's 8 bit ones, the 1802 code was only about 60-70% as long as
the 1802. I didn
didn't even bother using some of the coffee grinder type instructions that
would have made the 1802 look even better. Anyway, the punch line to this
is there is no way to just make the 1802 use a shorter instruction cycle.
So for instance, I would guess that for mem moves less then $100 bytes
the 6502 is as fast as anything if not quicker. For memory moves above
$1000 bytes or so the 16 bit indexing of other procesors would be quicker
and take a lot fewer instuctions. One of the first series of application
programs written were things like Tiny Basic. I remember at the time people
were shying away from the 6502 because the author could not get the code
paired down enough to fit in a 2k ROM. At the time a programed 2k ROM
could set you back $60 or something like that, so the prospect was pay
a fortune for ROMs/RAM/Power supply or use on of the alernative chips
like the 1802.
Never undersestimate the power of a rigged demo to impress.
Rick

1359. Atari 810 - Are schematics available

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-11 10:20:25 UTC
From: Masstorage@closer.brisnet.org.au
Message-ID: <6d0_9502111508@softtech.brisnet.org.au>
Source record: 94500

PlWas there ever an 'offical' set of schematics for this drive?

yes but mine are photocopys of photocopys.

PlAlso, is the piggyback board standard fitment, I thought that the 1771
Pljust plugged into the main PCB, but it seems to be on a seperate card
Plwith some MSI chips in this one. Anyone know what this board does
Pl(it looks like original Atari).

yes but only in latter 810 drives. It is called a data seperator board. The
1771 doesnot have one. the 2793 used in the 1050 has one built in.

1360. XL/XE Diag rom mapping?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-11 10:20:46 UTC
From: Masstorage@closer.brisnet.org.au
Message-ID: <6d2_9502111508@softtech.brisnet.org.au>
Source record: 94501

PlAnother stupid question, can anybody tell me precisely what the effect
Plon the memory mapping is when you turn on the 'enable diagnostic ROM' bit
Plon PB7.

The xl rom that is normally at $D000 to $D7FF (unused because that is where the i/o chip addresses are) is switched down to $5000 to $57FF. This is done by the pal chip in the xl/xe.

PlI've just discovered (after about 1 1/2 years!) that if you type 'BYE' on
Plmy modified 800 the system crashes :(. The ROM image looks OK, so I
Plthink the decode logic must be confused.

How can it be confused?? the decode logic is not there in the 800. Your xl rom MUST be modified. The XL rom checks it self out at power up including the self test rom which is not there. If it does not check out, the computer jumps to the self test if it can.
I have made a modified xl rom my self for the 800. I had 2 types. one slightly modified so it would power up properly and one heavily modified to include the soft reset, the memo pad (called it the XL MEMO PAD MODE) ,all 4 joysticks and 8 paddles. Unfortunately, i lost the files and will have to do it again. I even had a board that had 16k on it to emulate the ram under the roms on an xl and when combined with the axalon ramdisk compatible board i sell, a 130xe could be emulated (with out the antic bank switching).

Tell me more about your 800!

JW>mechanism off your existing XF551. The 551 is D1: and the 3.5" is D2:.
JW>In the CSS catalog, there's a picture of an XF551 with the additional
JW>3.5" drive sitting in a PC rail-frame on top of the Xf551. That works
JW>great, but it isn't pretty! I think it would be neat to install a DIN
JW>plug on the back or side of the 551 so I could accomplish the same thing
JW>by plugging in a SF314 drive....the double-sided 720K 3.5" for the Atari
JW>ST. Wouldn't that be a neat trick??

It sure would be nicer looking and better than having a 3.5" mech
just sitting there on top of the XF. That is one of the reasons I decided
to just have the "Single Drive Upgrade". Another reason is that a 1050
has been my main drive for years and I didn't want two formats of
5.25" disks.

>vs the 6502's 8 bit ones, the 1802 code was only about 60-70% as long as
>the 1802. I didn

I never really did a great deal with the 1802 once I got a 6800
system with floppy drives, but for a long long long time, the 1802
Elf was the only system I had that at least tried to pay for
itself. Due to my building the Pennywhistle modem project from
Pop.Elec., and needing a frequency counter to align the filters,
two evenings of tight coding got me a frequency counter to fit in
the 256 bytes available, and to display one the two digit hex
display in high byte, low byte fashion as you hit the button. I
did not try to decimal convert it though <grin>. I let the
operator (me) do that. Nice little one Hz resolution freq.
counter, which netted me an $80 (at the time) memory board, I
believe 8K, or perhaps 4, in a programming contest coinsiding with
my need.

>anything with 8088-code , sorry, forget it !!!

You don't and can't use the on board prom code ... just ignore it
and use the native I/O addresses for the card.

Checking the IBM Tech. manual:

The fixed disk controller has two registers that may be accessed
by the main system processor, a status register and a data
register. The 8 bit status register contains the status
information on the disk and may be accessed at any time. The 8
bit data register actually consists of several registers in a
stack with only one register presented to the data bus at a time.
Address assignments (in a PC bus .. may be made different
depending on how one wants to handle them in another system):

320 -- read and write data register
321 -- read controller status register/ write controller reset
322 -- read is reserved/write generates a controller select pulse
323 -- read not used/ write pattern to DMA and interrupt mask register

Gee -- that last looks like another register to me, so that makes
three.

The floppy drive adapter is a general purpose adapter utilizing an NEC
uPD765 compatible controller in combination with an 8 bit digital
output register. Digital output register, of course, is your
drive select and motor control register. The controller itself
contains a status register and a data register (sounds familiar).
Same setup, one writes and reads a series of bytes to trigger
operations. Address assignments on the PC bus:

3F5 -- FDC data register r/w
3F4 -- FDC status register (read only?????? -- not spelled out)
3F2 -- digital output register (w only) cleared by system reset

That covers it from the hardware point of view. Things are definitely designed to use DMA, it would depend on the specific requirements of the controllers whether programmed I/O could be made to work. I assume the 6502 would have no trouble keeping up though.

Kind of a commercial post, but it's not for me personnally. One of the oldest bbs's that supports the 8 bit, Compucat, is going WWW. They were a contempory with the famous Itsy Bitsy BBS. Matter of fact, Neal said the original operator of Itsy helped him set up the BBS. I think the original Compucat ran on four 810's with an 850, switched to an ST where it is still at today, but never stopped supporting the 8 bit. They have always operated an online store, matter of fact, my first 1050 & Action! cart were bought from them. They have an excellant reputation, Lucas Films even bought all their Supra 2400 baud modems from Compucat. The thing is Neal still has access to hard to find 8 bit hardware & software. I don't know how he does it, he may have an inside track on Best Electronics inventory or something. Anyway, they take Visa/MC & even American Express <at least they did for me, but then I've known them for about 10 years> The WWW location is still under construction. I don't have a graphics browser like Mosaic & a lot of stuff like mail haven't been implemented in VT100 mode. So, if you want to try an on line adventure & electric mall that has access to 8 bit stuff, have Mosaic type software.
I've had to (G)o to:
ftp://ftp.netcom.com/pub/nk/nkinney/html/
then open compucat doc from the list to get there, but you're supposed to be able to go all the way by:
ftp://ftp.netcom.com/pub/nk/nkinney/html/commpucat/html

>>Thanks for your offer. I'm looking for Scott Adams's SAGA series (the
>>12 classic adventures in the graphics version). Where can I get them?
>>[BTW, this is not a challenge or anything - I'd just like to play those
>>games, and I was not able to find them anywhere, neither for the Atari
>>nor the Commodore 64.]

Okay, here we go. The most recent picture catalog from American
Techna-Vision listed Scott Adams Text Adventures 1-12 for $12.50, and it
listed Scott Adams Graphic Adventures 1-6 for $14.95. However, the more
recent literature from ATV doesn't list either of these, so they may have
sold out by now.

B&C ComputerVisions lists Adams Adventures 1-12 for $14.95, and they list
Adams Graphic Adventures 1-6 for $26.95.

The next question would be, _were_ there Adams Graphic Adventures 7-12
released for the Atari?

Hi!

I have received *MANY* offers to buy and trade for the cartridges I'm offering. Unfortunately, not many people seem to be hitting the right keys. So, I'd like to change things a bit. To those of you who have already arranged deals with me, your cartridges have been set aside. The following items are still up for grabs:

Atari 7800 Atari 2600
========== ==========
1. Super Huey UH-IX 1. Kangaroo
2. Impossible Mission 2. Pac-Man
3. Fight Night
4. Touchdown Football Sega Master System
5. Real Sports Baseball ==========
6. Choplifter! 1. Hang On/Safari Hunt
7. Karateka
8. Galaga
9. One On One Basketball
10. Hat Trick
11. Centepede
12. Galaga

I will trade any three of the above games for one of the following:
^^^^^^ ^^^

Atari Lynx: Atari 7800 Tandy CoCo III
========== ========== ==========
1. Klax 1. F-18 Hornet 1. CoCo Max III
2. Dracula: The Undead 2. Water Ski 2. Max 10
3. Lemmings 3. Tank Command 3. Robocop
4. Ninja Gaiden 4. Tetris
5. Gauntlet III 5. Super Pitfall
6. Dirty Larry: Renegade Cop

My only conditions are that all games must have instructions and be in working order. If you want to make a different offer, please feel free. I'm fairly flexible.

Thanks!

>> Mark <<

I'm not sure, but do the 2.5-inch IDE drives have POWER
connections in the same ribbon connector as the data (i.e. - ONE cable
and no power cord??)? Just curious....

1380. James Wood: Apology: end flames, please.

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-12 05:49:28 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950211212529.11480M-100000@PEAK.ORG>
Source record: 94421

Readers: Who isn't tired of reading the flames by now?

I'm relatively new to the net. It seemed that I was in need of some disks and supplies for the ol' 8-bit. I posted a message asking about obtaining disks, etc. for the computer, and it seemed like days would pass with no replies. Evidently, there were replies, but it took some time for the delays. I'd post a message, and log on a couple days later, and there would be a slew of new messages all around mine, but no reply. Several people suggested the FAQ. The FAQ isn't always posted, and if it is, I'd likely need to use the roommate's IBM to read it; unless it can be easily understood in 40-columns....and can be loaded into the memory of a 64K machine (what's left over after the editor loads, of course).

I was also interested in, perhaps, someone saying "I just ordered X number of diskettes from _____ last week, and they were only X cents each! Would the FAQ provide that information? Nevertheless, I have received replies from a number of people, and I thank them.

I sincerely apologize for my outburst, which I now see was quite unfounded. Some people, such as Rob and Joe were quite nice in their reactions to my post. They are to be commended for their calm demeanor, and helpful attitudes. Once again, I AM SORRY.

However, the character of Rick_Michael_Cortese is another matter. As I gather he feels about me, I don't quite catch this guy's drift. He continues to irritate me, and I do not want him to misinform others about me. He (and another) did make a nice offer to send me some ROMS for my 800XL, which was great!

Rick has posted at least a couple of messages about my "RESPONDING" to his post with threats of a face-to-face confrontation. He thinks I am here "for flamebait," and that I'm "probably don't even own an Atari" - "probably a C64 user." He is wrong on all accounts.

What I didn't like (I'm sure my stating so is what irritated Cortese and drove him to continue the flames) was his attitude. Although I am no saint and my original flame was out of line, Cortese's messages to me were VERY egotistical, egocentric, condescending, smart-ass..... He attempted to assess my intelligence through my obvious inexperience with the net, and my lack of technical knowledge of computers. I've informed him in E-mail that it is easy for PERSON#1 to attempt to evaluate PERSON#2's intelligence based on a comparison in ONE area, which often happens to be PERSON#1's area of expertise. PERSON#1, finding that PERSON#2 is not as knowledgeable in that area as himself, erroneously attempts to assess the other's intelligence, and smiles gleefully in false illusions of grandeur. Cortese refered to me as "not being smart

enough" to read the FAQ, for example. Wouldn't this piss you off if he said it about you?

He's furthered the flames.....claiming that I'm "not real", etc. I really don't care what he says about me, but I would like to interject that much/all of it is not true. As above, I APOLOGIZE for the original incident. I don't expect Cortese to do so, for his tender ego is much too easily bruised. HEY CORTESE: CAN YOU AT LEAST DROP IT, OR TAKE IT TO E-MAIL??????

Thank you to all who have replied. I enjoy this base, I do NOT own a Commodore 64 (or ANY product with a C= on it), and I am real. I appreciate kindness and hospitality (much of which has been offered to me on this newsgroup), and (as anyone) I resent smart-asses. I assure everyone here that it wasn't the former (from Cortese) that evoked my respond....it was the latter. He's so good at it that perhaps he should specialize.

James

1381. WTB: M.U.L.E. + quest. about loading

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-12 06:00:48 UTC
From: cecarman@miavx1.acs.muohio.edu
Message-ID: <1995Feb12.010048.39407@miavx1>
Source record: 94422

I have a question and sort of a request....

First of all, I've booted up my old Atari 800 and I can't remember how to load Basic files from disk. Is it like LOAD "FILENAME.EXT";8,1 or something like that?

The other thing is that a guy I loaned software to a while back won't give me my stuff back, so I was looking to buy Electronic arts' game "M.U.L.E." You're an alien that inhabits a colony planet and tries to get rich... if anyone has this, I'd really really like to buy it.

Anyway, that's it. Thanks! Later,
-Chris Carman
-cecarman@miavx1.acs.muohio.edu

1382. 8-bit printers

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-12 06:14:34 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950211220707.11480N-100000@PEAK.ORG>
Source record: 94423

DISCLAIMER: UNFORTUNATELY, I DO NOT HAVE THE FAQ HANDY. I DON'T SEE IT POSTED AT THE MOMENT.

I'm looking for a printer to hook to my 8-bit (CORTESE: YES, I HAVE AN ATARI). However, I can't find any (circa '80s) Epson printers in my area. However, I do recall that one needs to usually change a DIP switch, to set the printer for AUTO LINEFEEDS with a carriage return. I still remember the first time I hooked up my MX-80 and had everything print on ONE line!!!

I've been looking for a printer, and noticed that just about the only thing available now is Inkjet printers. The Canon BJ-200e is a pretty good price (relatively speaking, for printers). It offers "Epson LQ emulation" - but how far must the emulation go to be compatible? Can you switch the LF?? When printing with the Print Shop (which frequently prints to the edge of the paper), will this work with an inkjet which sometimes do not go to the edge?

Is this emulation going to work with graphics, or just text?

I also found a good deal on a used Okidata Microline 320. However, there's no manual, and I don't know if it's Epson compatible, or if the CR-LF switch can be set. Anybody use one of those with the ol' 8-bit??

THanx.

James

I just developed a cable, that when connected to your PC's and Atari's serial ports, will enable you to transfer files between the two. Also, there are two program for the PC that you can use to change Atari written text to PC formatted text. Any comments, questions, etc.???give me an email.

1385. Re: VGA card (was: ever a workable 80-column mod)

Newsgroup: comp.sys.atari.8bit

>8-bit to the PC-bus, but it allows one to connect cards, which should be
>plugged in an 8-Bit ISA socket on your PC, to your atari 8-bit cartridge
>port.

Thanks, Ivo. I didn't understand. But I still think, that connecting a card
to the cartridge port isn't good solution: You still cannot connect a 16-bit
PC device, like AT-BUS drive (please, don't write, that it is impossible to
connect something like this directly to PB; I've got such a disk; and it
was much cheaper, than any MIO, because the interface (without a drive)
costs under the million polish zloties (= less than 100 new zloties = less
than 40 USD)).

>Why a VGA card? Ever thought of the tremendous amount of disk space needed
>to store a 320x200x256 picture?

Off course, I thought. It is 64000 bytes. Uncompressed. Too much? Buy a
hard drive.

> I think a CGA card would be great enough.
>Good quality 80 columns display! That's what's all about. Or maybe an
>old fashion SoundBlaster, you know, the 8-Bit ones. I doubt if you can
>get the DMA to work, but the sampler and the ADLib certainly add some
>to your XL.

Yes, You are right. The CGA is great enough, if You mean 80-column display
only, but its graphic mode doesn't look very exciting... My grandmother
said: "If we are going to do anything, we should make a good job, or nothing."

About Sound Blaster: some months ago my friend built a sound card for Atari.
It has the two 8-bit D/A converters and the two 8-bit A/D converters. It is
connected to bus and works fine without any DMA.

>>If we install a VGA card in our beloved computer :), we can piss off the
>>ANTIC and GTIA then easily accelerate CPU to, for example, 3.54 MHz.

>We can not. ANTIC also generates the RAM refresh cycles.

Static RAM-s don't need refresh cycles. But even if we don't change RAM-s to
static, I think that ANTIC will do its job (we needn't care, what it will
try to display by Composite Video).

Hi, I just pulled my old 130XE & XF551 out of the closet and have been revelling in the memories of times when games were really games, original, and fun to play. And in my rummagings I found two of my all time favorite games: Dunzhin and Kaiv by Screenplay. There were supposed to be two others in the series called Wyld and Ziggurat and I'd really like to have them. If anyone's got 'em, I'd like to buy them. Especially if they're still on the Atari/C64 flippy's.
And the disk version of Telengard would be up for serious consideration also.
Email me at wlas@delpi.com OR austin@planet.net

Ben; if your in the SF bay area you may want to try the SLCC bbs. I've only got a nuber from a couple of years ago so it may not be good anymore. (415)352-5528. Bob's a great guy, but he's also the busiest guy I've ever seen. Works on IBM mainframes for groceries, kids in college or getting married or something all the time. He constantly gets tapped by the SLCC ST users for help since he seems to know everything about anything. In a typical converstion he may say something like, "I was opening my mail the other day, wait this is postmarked 6 months ago." He writes up everything he does, usually in the SLCC Journal. It may not be the quickest path, but if you try to find him on the BBS or the write up or the journal librarian or ??? you may be able to get reprints.

1389. What machine is best to hack?

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-12 19:31:31 UTC
From: scroggkw@Rose-Hulman.Edu
Message-ID: <scroggkw.26.792617491@Rose-Hulman.Edu>

I have a question, what Atari 8-bit is the best to hack, and what all can be done to it? I have seen posts about people who have 800XLs able to run as 800s (I guess they can run games like Gorf?). Is this the best machine to do? Do you just steal the 800 ROM cheap from the machine? Anyway, any information would be nice, I need something to do next term, and hacking Amiga 1000s is starting to get boring (and expensive too!).

BTW, I've never had a 800 XL, or any XL at all. I do have a 800 (purchased when it came out in 79 or 80 for $800! I was 4 at the time!) with a 256k upgrade (that was a mint also!), a 400, 130Xe, and XEGS. Also have over 50 cartridges, and 200+ software titles, all original. Still use the machine too, but I don't have one at school, so I can't use it now! Parents wouldn't let me steal what I wanted (A floppy drive and games, only have 4 floppies, all us doubled.)

Thanks for listening to my rambling, anyway, if you wish to offload an 8-bit computer, I might be interested.

Thanks
(Emailed replies prefered, my news server tends to 'misplace' articles!)

r >
r >P.S. For that matter, what are the formats used by the 180K SS/DD
r >drives?
r >
r >Rich
r >RichCZeta@aol.com

Howdy Rich

Taken from Atari Software Protection Techniques by George Morrison, Alpha
Systems (learned me a lot about directory and VTOC layouts, which comes in
handy when you want to shorten a file (e.g. take of a bit at the front, the
back or the middle, or all of the above).

VTOC Sector Layout

Bytes:

0 Type DOS ( 0 = DOS 2.0 )
1+2 Total number of sectors
3+4 Number of unused sectors
5 Reserved
6-9 Unused
10-99 Each BIT in this area represents a specific sector ( 0=used, 1=unused)

The book was written before enhanced density existed. That last line should
now read, from 10 to end of sector.

DOS 2.5 uses sectors 360 and if necessary 1024 as a VTOC.
MyDOS uses sectors 360 and if necessary 359, 358, etc. if necessary.

Only sector 360 "loses" 10 bytes. All other VTOC sectors start there
"used/unused" info at byte/bit 0.

Howdy Folks

There already exists a program to READ ST/IBM format disks on the XF551.
It comes with CSS's XF551 3.5" Upgrades. It's written by Jeff McWilliams.
You can NOT write to these disks in ST/IBM format, because the XF551 does not
have sufficient memory to hold the 512 bytes the ST/IBM stuff into a sector
(well, that's what Bob Puff sais.)

If you want to read, write and format ST/IBM format disks on your Classic
Atari, you're gonna have to spring some money for the BlackBox/FloppyBoard
option.

Howdy Itay

YES. I want this. Please write some FAX software for the classic 8 bit.
Maybe you could use horizontal scrolling, flickering or even better yet, the
XEP 80 (which can be really fast if you know how to) to display the page.
I guess an option to dump the page to the printer (either after or during
transmission) could come in handy. Would be nice to be able to write a
letter using T:EDIT or Atari Writer (80/plus) or whatever and then send it via
FAX.

Hmm, I guess Supra Corporation has some data on FAX protocols on there BBS.
But I'm not sure. (503-967-2444 or supratech@supra.com)

BTW mine's a V.32bis external and can handle data, fax and when the upgrade
finally becomes available, voice. All at up to 14k4 baud.

j >
j >James
```

Howdy James

Yes, I've been here for a year, maybe a year and a halve. I'm the silent type you know. And I'm sometimes having problems getting here.

Those problems can consist of the following;

- My providers phone line is busy,
- I hate SpartaDOS
- PabQWK doesn't like huge messages (like FAQ's). If this happens I loose everything from that message on. Or I have to "sector edit" the whole file, changing "inverse lowercase c" to ATASCII Returns and shortning the whole file (copying 1000+ DD sectors to screen is not funny. And I don't have to memory or the word processor to handle files like these)
And SpartaDOS is not the easiest format when it comes to "cutting files in halve and throwing away the first part.
- One of my keyboards died a couple of month ago
- My 130XE has a flaky POKEY I guess (I've had atleast 2 die on me after the GUMBY upgrade)
- The power supply I'm using to feed my BlackBox and FloppyBoard had two cases of "I'm giving up". The second time was the weirdest, if the drive head would move to abrupt, the supply died. Cured that one by resoldering the whole thing.
- PabQWK doesn't allow the use of long addresses.
- I have problems with my providers computer.
- I don't feel like fighting these problems to tell something to somebody.
- One, some or all of the above and maybe even some I forgot.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS And last but in no way the least. I fell in love with this woman.
But that's another story (which you might have read on the PRO-net :-))

Howdy Folks

CSS sells the Bit Writer for the 1050. But it won't work without the Super
Archiver (either I or II), also by CSS (see vendor list). It's probably
the only thing that copies (almost?) all disks.

BTW since I use my 1050's only when I have to, and don't have that many
commercial software, I neither own a Super Archiver nor a Bit Writer.

Howdy Folks

How about this one: PRINT FRE(0)

Re: DOS formats

Except SpartaDOS, all DOSses use basicly the same format.
All versions of MyDOS (that I know of) use four digit sector counts, except
version 4.53/3 (4.53/4 uses four digits). If necessary, but only then,
MyDOS 4.53/3 will use four digits or even five (4.53/4 will do this too).

Remember that MyDOS does NOT use filenumbers in the sector data, as all other
Atari-DOS-alikes do. (Tip: filenumber 0 never has the filenumber in the
sector data).
```

And last but not least, Enhanced Density can be a problem when using either DOS 2.5 on MyDOS disks or vice versa. One can't read Enhanced Density disks from the other, the other can only partly read ED disks in #1's format. Don't know how this exactly works.

(If somebody could come up with a utility to add or remove filenumbers, please tell me. I've been looking for such a utility for ages.)

1401. Re: VGA card (was: Ever a workable 80-column mod)

Newsgroup: comp.sys.atari.8bit
Date: 1995-02-12 21:00:06 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BOw4rD2.lmcclure@delphi.com>
Source record: 94442

In a message dated 2-10-95, Ivo van Poorten said:

"Why a VGA card? Ever thought of the tremendous amount of
disk space needed to store a 320x200x256 picture? I think
a CGA card would be great enough."

A CGA card would be good enough for a decent 80-column display, and would support 16-color ANSI text for BBS use. Also, if one had a RGBI/composite monitor such as the Commodore 1902 or 1902A, or one of the Amiga monitors that handles both types of RGB, one could run the native Atari display and the CGA card display on the same monitor. Also, CGA cards are dirt cheap.

Those are the pluses of CGA. The negatives are that monitors that handle RGBI, AFAIK, are no longer being made by anyone. Also, I expect CGA cards themselves will suffer the same fate before much longer. After all, unless one is running on an old XT, why buy a $19 CGA card when you have basic VGA (or better) for $10-$20 more?

The pluses for VGA are better resolution (even when running in "CGA" modes), and improved graphics capabilities. Also, with VGA one can be assured of being able to buy a new, compatible monitor anytime for the foreseeable future. As a plus, uses VGA-only monitors, and even less-capable SVGA monitors are sold cheaply by PC folks upgrading to cards capable of higher resolutions.

As to storage, that 320x200 256-color pic would take 32K to store. Even a bog-standard 810, one could fit two per disk with room to spare, even using no compression. With something like a US-Doubled 1050, at least 5.

The biggest minus I see (aside from the need for two monitors), is that 8-bit (XT-type) VGA cards are as rare as hen's teeth nowadays, especially if you are looking for a reliable source of new cards. The basic $30-$40 "bargain" VGA cards are meant for the 16-bit ISA slots in 286-based and better machines.

1402. Best games ever for 8 bit atari

Newsgroup: comp.sys.atari.8bit

In article <199502121443.IAA24755@mail.cs.utexas.edu>,
Konrad Kokoszkiewicz <CONRADUS@PLEARN.EDU.PL> wrote:
>
<basically about the feasibility of a PC bus style interface to Atari>

>PS. Another sentence, that said my grandmother: "We live to our dreams become
>reality".

The problem I see about all this is a point is rapidly reached at
which it becomes easier and more versatile to build an Atari onto
a PC bus card and be done with it. By the time one starts adding
all the mapping registers and 16 bit data registers and timing
logic and ....

Two other alternatives present themselves to me, and I am sure
there are others. The first, and I think I have read posts here
saying someone did this once commercially and got slapped down by
Atari, but now that would be unlikely, and a non-commercial hack
certainly would be feasible, would be to build a PC ISA board with
a 6502, dram, ROM, Antic, Pokey, GTIA, etc, with a mini DIN video/audio
output, and the joysticks and SIO port in an expansion box. An
ISA bus I/O register could simulate the Atari keyboard, and a
control register, and use dual port RAM for the communications
between Atari and PC ... heck there would be no need for the ROM
at all, just part of the dual port RAM which could only be written
from the PC side.

The second alternative is a dual port RAM setup which would allow
the Atari and the PC to have a relatively high speed
communications channel, sort of a super speed SIO2PC with it's own
protocol. Heck, even a straight parallel to parallel SIO protocol
with expanded devices could be enough give lots of improvement.
SIO2PC at 19.2 K baud is about 2000 bytes per second, with even
the same bus specs but expanded to 8 bits plus strobes we could
manage 50,000 bytes per second, and probably with terminated lines
and decent drivers we could have a basic rate of several hundred
thousand bytes per second, faster than the Atari could generate
anyways in a programmed I/O mode. Add a PIA in the Atari, use
both ports and handshaking lines, and a similar setup in the PC.
A 6820 in handshaking mode could certainly take data as fast as
the Atari can generate it and check the handshaking lines, and
transfer it to the PC with line driver/receivers to keep
everything decently clean signal-wise. I would say 8 bits, a
strobe and an acknowledge in each direction, 20 lines altogether,
in a ribbon with everyother line grounded, or with differential

driver/receiver chips and lines. Assuming that the speed limitation is on the Atari end, and that the 6502 running at effective 1.3 MHz or so is about 50 percent faster than the 6800 (since I have not done machine code on 6502s for my experience base), than a data rate of the order of 50,000 bytes per second should be managable easily in a programmed I/O mode. With a FIFO of some sort on each end, a burst rate of 500,000 byte per second may be quite possible.

Best isn't my favorite to use. Best hands down is an 800XL, preferably with the motherboard fully socketed. The only problems come up when you don't have a socketed mother board, then it tough desoldering the chips to make mods. Since it has a built in parallel buss, it's easy to expand. What most people do is just buy an after market OS. I think I've heard of about 5 or 6 different OS chips, it's kind of choose your flavor. 130XE are nice if you don't need/want to hack them because they all have the chips soldered directly to the mother board. 1200xl, possibly the worst Atari ever made, is my favorite after it's been modified. The only thing you miss is the PBI & if you aren't afraid of working under the hood, it's not a problem. The other thing about the 1200 is it's fully socketed & has the best keyboard.

>
>First of all, I've booted up my old Atari 800 and I can't remember how to load
>Basic files from disk. Is it like LOAD "FILENAME.EXT";8,1 or something like
>that?

I think you were meaning: LOAD "FILENAME.EXT",8,1
which is actually for the Commodore 64.

On the Atari - you just type: LOAD "FILENAME.EXT"
and that's all. If you have a basic file that you LISTed to disk (perhaps
you do as I do, and use the extension .LST), then you just type:
ENTER "FILENAME.EXT"
or just e. for enter.

Hope that helps.

The author of Ice-T speaks.

I tried making my 80-column (not flicker) into an E: device, but it was harder
than I thought because I have to take control of everything: Screen output,
screen input (whenever you type anything, or even moving up with the cursor to
another line and press Return), control codes, handling line-wrap,
handling system-resets, and making it all invisible to the system.. Maybe
even sticking it in banked memory.. hmm.. but this is NOT easy, and it's gonna
be a memory hog. By the way.. I also gave up.

Stay tuned for Ice-T 2.0 XE!!!!!

There *IS* such a utility. Goodness, I forgot the name, but I think I got if off the umich archives......blast, I wish I could recall it; I don't have it in front of me now.

Anyway, it works on SIO2PC files (.ATR extension) rather than the .XFD disk image files. I had to fire up Xformer and (using Atari DOS) copy the files from the XFD disk to the ATR disk, then extract them. It worked flawlessly, I might add.

Well, MyBBS 0.0 is kinda crappy. Very nice for being a "1st working BBS" by me, but it's too big to be compiled with Action!'s runtime, so it REQUIRES an Action! cart. It's not smart enough to log out if someone hangs up, and there are plenty of other problems. I've almost considered writing a BBS language and writing a BBS within it; I'd feel much safer. :) (Why do I still use BASIC so much!? (other than for the floating point? :)))

NEEAAAHHHH!!! <shudder!>

LOAD "file",8,1 is a Commodore 64 BASIC bug.. I mean command. ;)

Umm.. to load a BASIC file, it's:

LOAD "D:filename.ext"
\
D: is disk, C: is cassette, K: is keyboard, S: is screen, E: is editor
etc.

Also, to load and automatically RUN, go:

RUN "D:filename.ext"

You cannot load binaries (very easily) from BASIC. Jump to DOS (type "DOS")
and use the "L" command (if using Atari DOS/varients (like MyDOS)).

RICHARD GORE
I think you came across as being rather pompous.To call my letter sad is just downright ignorant.I was purely trying to provoke a response from a group I have only just become aware of.I also feel that 200 games is a lot when you consider I paid for every one of them - and this was when cartridges cost around 30.The Red Rat situation is something I'm well aware of as I have most of their titles.To be honest,none of them were all that special,although I enjoyed Little Devil and Crumble's Crisis.
I am sure there are people who still make software for the 8-bit but it would be too costly to keep buying everything from the states;especially if you have a PC to support.I am purely in this group on a nostalgia trip.I only get my Atari set-up to play games now and again.
Do not be so quick to insult people Mr.Gore.

> ...
JT> What would really be neat for me is a term program written in BASIC.

Well, self-bootstrapping has always been a problem. If there are
absolutely no ATARI 6502 people around you who could dump --ANY-- term
program to disk for you, you might try the following:

1.) Type in the "RECEIVE" program in the ATARI 850 manual.
2.) Download the program AMODEM version 7 to your PC.
3.) Connect the ATARI 850 to the PC serial COM line.
4.) ASCII send AMODEM version 7 from the PC to the ATARI receiver.

NOTE: AMODEM is largely written in ATARI BASIC and is about six pages
long. The program contains a few short string-encoded binary assembler
modules of a hundred bytes or so. Walk through the assembler module
strings and graphically verify that the ATARI graphic shapes match the hex
dump values of the code block as they appear on the IBM PC. The ATARI
BASIC text should be directly readable, provided you are using an ASCII
listing -- which has an extender of "*.LST" -- rather than tokenized code.

So much for the term program, now you need the ATARI 850 "R:" handler
ROM Loader program. You will have to make a HEX DUMP of it off of the PC
and type the 200 or so bytes directly into a file. (I actually did this to
get an R: handler loader into double density once.) To do this you enter
the commnd:
COPY E:,D1:xxx.SYS

...the screen will clear, then you type --VERY-- carefully. When you
finish typing, you press CONTROL-3, which is ATARI End-Of-File on input.
Then you rename "xxx.SYS" to AUTORUN.SYS (the ATARI version of "HELLO"
and "AUTOEXEC.BAT") and keep your fingers crossed. When next you reboot
your machine you should hear a long "B-O-O-O-O-O-O-P!" as the "R:" device
handler is loaded in from ROM to RAM.

Once you get AMODEM up and running, use it to download BOBTERM and
keep AMODEM and perhaps a printer listing of it as backup in case your disk
boxes get damaged (or keep a spare ASCII listing on your PC). AMODEM is
one of the few term programs you can type by hand. Good Luck! It is

better if you can find an existing ATARIAN in your area to get a copy of a term program from. Hmm... here's a thought: If your PC is 386 class or better, perhaps you could get a copy of PC Transformer 2.5 off the network, then download AMODEM into it, and use it to check that your binary code ATASCII strings match the graphic strings on your ATARI 6502 8-bit. Good Luck.

>combined into one 16 bit forward pointer, but...

No, I guess MyDos don't use file-Pointers (as other DOS f.e. BIBODOS too)
when the number of sectors is larger then 1023. They need the full 16-bit
word to adress all sectors and thats why they could use Harddisks til 16MB.

X > do on the atari, and how muck will it cost me to do this?

You can program in MC6502 assembler, C, Pascal, Logo, BASIC, Lisp, and a
special Pascal/C variant called ACTION!. ACTION! is considered to be one of
the best programming languages for the 8-bit. It's high level, but compiles
down to code that is near assembly speed.

Cost all depends on where you can find a good deal. If cost is a problem
you might consider CC65. It's a very good C compiler for the Atari 8-bit,
and its freeware.

Yes it should have a set of utillities, and some examples of macro programing on a single disk. Also there is a tool kit that is a seprate disk which contains macros for many usefull functions. I've heard bad things about the toolkit, but so far it hasn't been a problem for me.

>

I've got the cartridge and toolkit, and none of it comes with floating point support. The ATARI floating point package isn't all that difficult to program in assembly anyway. All you do is hand off a bunch of values to the package, and tell it to do the calculation. It then dumps the answer in one of the floating point registers. It's slower than integer math though, so it's better to use floating point if you can. Atari Basic got a bad rap in the computer world for being slow, because it relies on floating point for all it's calculations.

I also remember Ollie's Follies, which is one of my favourite platform
games ever. I believe Frank Cohen did Scrolls of Abadon (sp?) as well.

There was a Frank Cohen game released for the 8-bit Atari in 1986 or
1987, and it could have been his last game for that computer. According
to the description on the tape cover, it was about a boy escaping from
his own friends, after he had failed in a baseball match. The game did
not seem to be about that, it was an ordinary platformer with some
character moving around, collecting dots, avoiding enemies. I don't
remember the name of the game, although I know I have the original copy
somewhere.

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hO94U4C.lmcclure@delphi.com>
Source record: 94378

In a message dated 2-14-95, Richard Morris said:

"Not meaning to pick, but 320x200x256 is 64K."

ARRRGHHH...I hate it when that happens (making a stupid mistake on a worldwide newsgroup).

I can only plead that I was thinking "Okay, it is exactly 2x the ST screen, which is 32K", and forgot about the "2x" part. <grin>

As someone else noted, that cuts the storage for uncompressed pics to 1 per SSSD disk, a tight fit for two on a SSED disk, and still no room for a third on a SSDD disk.

At least the point is still valid that even on the most minimal system, a 256 color pic could be loaded and saved to disk. Considering that most folks going for such a display would likely have enhanced systems (i.e., at least SSDD drives, probably a DSDD XF551 or 3.5" converted XF551, or even a hard drive), I do not believe storage is a significant limiting factor. After all, a standard XF551 could store at least 5 pics, one with a 720K 3.5" mech, at least 11, and with a hard drive...well, let me just remind everyone that when VGA first appeared with IBM's PS/2's, an 40MB hard drive was considered adequate for most folks, and 80MB was "big".

But the upgrade to a monitor output for the 600XL is available at the
Cleveland Free-net, got it the othernight and am preparing to do it, as
soon as this sio2pc cable of mine decides to work. It is easier than you
would think, all the circut traces etc. are on the motherboard! Atari just
decided to forgo the monitor output at the last moment as a cost cutting
measure. Just put in all the parts, solder in a cable and away you go!

Ah, but you can add a PBI to the 1200XL! Bob wooley did this hack, I have a
copy if anyone wants it, or go to the umich archive, it's up there now in
the "mods" section.

>Thanks!
>John P. O'Neil
>joneil@infi.net

I haven't tried running XFormer under Windows 3.1 but it runs great under
OS/2 Warp in fullscreen and windowed mode.. (I setup the object's settings as
those for a game, since it tends to be processor-hungry because of the
emulation of the Atari's custom chipset.)

I will have to say XFormer is one of the most impressive programs I have seen
in a long time, since I was really into 8bits a few years back... I recently
got out my Atari 800XL(256K) setup to benchmark XFormer against and my 1050
died unexpectedly :(

Views expressed are mine alone and may not reflect the opinions of my next
door neighbor.....

Although, I am 6000 miles from my Atari computer in America, I am curious to hear from this group of what the best games of all time for the Atari computer are? I would vote for the following:Blue Max, Necromancer, Zepplin, Shamus case 2, Pinhead, Preppie 1&2, and Wingman.
Synapse software, in my opinion, was the best software producer for games.
I am interested in hearing everyones opinion, even if it means telling me how wrong I am in lking the above mentioned games, I will be returning to America, in late June, and cannot wait to play once again all of the classic games on my Atari Computer.
I wish everyone the very best, Jvogel

Hi There.

I have about three years worth of old Antic and Analog magazines I would like to give to someone. I even have disks to go with some of the Antic magazines. I would prefer to give them to someone locally (i.e. the Boston, MA area), but I would consider shipping them to you if you pay for the postage.

Please e-mail me directly if you are interested:
pldurante@read.tasc.com

Cheers,
Pat

Still is for a lot of people. Up until last year I had an 80MB hard drive and used less than 15MB of it. Then it crashed and the smallest drive I could find to replace it was 120MB. And I'm still only using 15-20MB. That includes a C compiler, a Pascal compiler, two assemblers, two debuggers, Deluxe Paint IIe, two text editors, two word processors, 4DOS, the usual utilities, and lots of source code and art for various projects.

I do have to wonder at the folk (not you Lonnie) who have posted about wanting to use gigantic hard drives with their Atari 8-bit machines, i.e. half-gig or larger.

Source record: 94395

```
: Look around. Patience will bring dividends. I now have
: 200 or so blank disks that will last me the rest of my life.

This got me thinking.. I have about 100 disks filled with utterly useless
material.. Will these disks still be formattable 10 years from now or do
they `rot'? It seems like whenever I get my hands on old low-density, or
"nobrand" disks, a select portion of them simply will cause errors
formatting, and I have nothing to do with them. Why does this happen?

: >old 800.. The mono monitor is much better though.

: Which brings up a question. Was this with the composite output,
: or the luminance one?

snip

Plugging in various plugs into the TV (there are 4), one is sound, one is
just plain video, one is nothing (a few shadows or something like that),
and one is pure 320x200 incredible (on a 21" Sony Trinitron) pinpoint-
sharp b/w. On the SupVid 130xe, that is.
The 800 is similar, just not as sharp. And I still like the "look" of the RF
and composite output of the 800. I have no split-input monitor, so I can't
compare the two in this *very important* respect.

Well Richard :) That's the thing, I have the type of 800XL with the sucky keyboard.

And >I< was using a Timex Sinclair 1000 membrane keyboard long before I ever even got an Atari (or even letter grades in school! :)) but when I did it was a 1200XL. That's why I'm complaining. :) I've been babied.

Is there a way to hook up the other 800XL-style keyboard to this 800XL? This one has the inversed Control-key character symbols. 800XL's are kinda ugly, actually. :)

William Kendrick (kendrick@zippy.sonoma.edu) wrote:

: Oh well! Sorry folks!
: I'm dumb!

Bill, I TOTALLY agree with you! ;)

Did I ever mention that Joust *RULES*?

Hehe.. I set it to Expert, and just played and played.. After Wave 99 it's
just Wave 0 from then on. And when the scoreboard passes 9,999,999 it's back
to 0 (too bad it's just a 16K game, they could have added "you win" demos)..

It RULES! What an amazing game! The enemies are sooooo smart.. and it's
NEVER frustrating.. The bird jumps on you and you're speechless.. WOW..
who the hell wrote this!?

And I found a bug.. If you kill the Pterry (cool name), and, while he's
flickering red on the screen, the wave ends (last bird falls into that red
void or something like that), he goes back to life (usually killing you)
and rushes out!

And why is my joystick's autofire slower on my 130XE than on my 800??!?

Anachronistic computer enthusiasts:

By the time my system gets posts, all the good stuff is already gone, so I am forced to be proactive. There is an assortment of stuff here, so look it over.

I am mainly looking for trades for Computer (C64, C128, Atari 8-bit, TI, CoCo) and Video game (Atari 2600, 5200, 7800, Colecovision, INTV, Tomy Tutor, Bally, Fairchild, Vectrex, etc.) stuff that I don't have, but if you have something interesting to trade, let me know.

If you have nothing to trade, there are prices. If you don't like my prices, make an offer. I am looking to increase my coolection and find some cool stuff, not to make money. Email if you have any questions.

Bob

Trade List

(Prices are for the benefit of people who don't have anything to trade, and are based on similar items I've seen on the Net in sales and auctions. If you don't think a price is right, I'm flexible, make me an offer. Higher offers welcome too!)

William (Bill) Kendrick / | \ ** New Breed Software ** Finger me at VAX
Coming soon: my WWW home page!

Oh yeah, they require 386/486/Pent. (actually, Xformer 2.5 goes on 286 too)

: Someone reponds to that guy about "is my 600XL a good setup?" and says that
: the 600XL won't have enough RAM to run most XL software.

: C'mon! Read more carefully! He said right there "expanded to 64K"! :)

: And I thought >I< was unobservant. I mean look... wasting bandwidth and all!
: <sheesh>

Having made the original 600XL posting, and not having seen the post
you're referring to, could someone please forward the thread to me?
Articles seem to be going missing :(

Thanks,

Jared

>I also remember Ollie's Follies, which is one of my favourite platform
>games ever. I believe Frank Cohen did Scrolls of Abadon (sp?) as well.

He later did "Regent Base" for the ST... As for games:

Clowns & Balloons (DataSoft)
M.A.S.H. (20th Century Fox Video Games)
Ghost Chaser (Artworx)
Cohen's Towers (Fanda)
The Scrolls of Abadon (Access)
Ollie's Follies (American Eagle)

Didn't stick around any company long, eh?

> Shamus case 2, Pinhead, Preppie 1&2, and Wingman.

I personally found Shamus bloody annoying:death by wall touching was never my
idea of fun!The Preppie games were excellent.I loved games like Donkey Kong
and Donkey Kong Jnr.

> Synapse software, in my opinion, was the best software producer for games.

Here in the UK I would say this honour goes to US Gold who helped us get games
from the states such as all the Datasoft and Synapse titles,courtesy of the
Americana label I think.They also did their own stuff (Gauntlet,Ace of Aces
(I think!),and some others i can'think of off hand!).
Tynesoft supported the 8-bits on these shores too.I also thought Activision
